The Wyandotte Family

Pre-eminently the Breed for Broilers and Unexcelled as a Market Fowl—Good Layers, Setters and Mothers

By FRANK H. THOMAS, Los Angeles

THE WYANDOTTE FAMILY, comprising the White, Buff, Columbian, Silver Laced, Golden Laced, Silver Penciled, Partridge and Black is strictly of American breeding, although this breed has in its makeup the Hamburg and Dark Brahma. In size they are halfway between the two, and many of the present characteristics of shape, comb and disposition are traceable to either one or the other of their ancestors,

The wide range in color of plumage found in the eight varieties, give the fancier ample opportunity to practice his skill in producing specimens with markings as delineated in the American Standard of Perfection.

When bred according to standard requirements they are indeed a beautiful bird and are well named the birds of curves Every section from their beak to their tail should be a graceful curve, and indeed are very symmetrical when approaching perfection.

First Prize White Wyandotte Hen
Denver and Colorado Springs, 1905
Owned by Inglewood Poultry Farm, Inglewood, California

They should have a rose comb, set firm and low on the head, top oval and surface covered with fine round points; the entire comb and spike curving to conform to shape of skull, and should be bright red. The eyes should be bay or bright red.

They should be broad and blocky, with broad full-rounded breast. Legs should be strong and of medium length. The standard weights are, for cocks, eight and one-half pounds; cockerels seven and one-half pounds; hens six and one-half pounds; pullets five and one-half pounds.

The white variety is the most popular, and forms the largest class at many of our shows, both east and west. It is in fact taking the place of the California favorites, the White Leghorns.

They are certainly worthy of all the praise bestowed upon them for they are both practical and fancy. They are the fowl for the amateur and fancier, and unexcelled for the market. Their laying qualities, under proper care and management, have equaled the Leghorns and Minorcas, and they greatly excell them for market and table purposes. For broilers, they are ready for the market at any age and of any size required. They are at all times free from black pinfeathers, found in the dark varieties. For roasters weighing two to four pounds no birds excell and few equal them.

The silver variety is a very striking bird and at one time was bred very extensively, but of late years the newer varieties are taking its place. The Silvers were and are still bred by many in England and much of their beauty we owe to our English cousins, for they have improved their lacing very much, and many of the leading fanciers in this country are importing them to improve their flocks. This to many may seem absurd, but when it comes to producing lacing and colors we will doff our hats to our mother country. For practical purposes they are much the same as the white variety, excepting the dark pinfeathers.

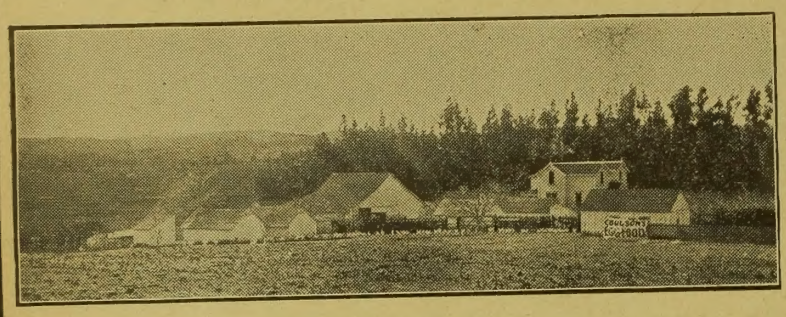
The Golden, Buff, Silver pencilled, Partridge and Columbian all have much to recommend them to the fancier, and their admirers are striving to perfect them along fancy and practical lines. The Buffs have many good qualities, and a Buff is always a favorite either for fancy or market.

The Columbian is the latest production, and bids fair to outdo many of the older varieties, We expect in a few years to see them in the front rank with the White variety. They should have the same markings as the Light Brahma, with clean yellow legs.

All Wyandottes are good setters and mothers, lay a good-sized egg, are good foragers, and do well in confinement.

Poultrymen

How Much does your Feed Cost You?



ONE OF OUR CHICKEN RANCHES

If you mix your own Mash Food for the hens, you will find that it costs you as much, or more, than if you feed

Coulson's Improved Mash Egg Food

A sack of ***Coulson's Improved Mash Egg Food*** will feed 1250 hens one meal.

1 Sack Improved Mash, about (Morning feed.)	$2.00
1¼ Sacks Wheat, about (Evening feed.)	2.25
	$4.25

Here is another way of feeding:

15 pounds Beef Scraps	$ .55
25 pounds Bran	.30
Sack Ground Chop	1.40
1¼ Sack Wheat	2.25
	$4.50

In the first instance you have a concentrated feed, containing all that a hen requires for health and egg-production, ready mixed for use.

In the second instance, you have the old method of feeding.

If the two ways cost the same, the first method of feeding COULSON'S IMPROVED MASH would still be the best, as it would save you time, and trouble of mixing, and get better results from your hens, owing to the greater amount of protein in the food, the perfect balance of the ration and the CONDITION POWDERS, which keep them in a healthy condition.

COULSON'S IMPROVED MASH actually costs less, however, and the reason of this is easy to explain. Being a highly concentrated feed, the hens require less of it, thus saving heir digestions, and the poultryman's pocket.

Feed your hens COULSON'S IMPROVED MASH EGG FOOD, and you will get a greater number of eggs with a smaller feed bill.

This is why COULSON'S IMPROVED MASH EGG FOOD has such a great and increasing sale. You had better get into line with the other poultrymen, use COULSON'S IMPROVED MASH EGG FOOD AND INSURE yourself a good profit.

Poultry Raising in California

Prices for Eggs in the Past Five Years Have Steadily Increased. Some Practical Suggestions on How to Care for Poultry to Obtain Best Results in Egg Production

By FRANK H. THOMAS, Los Angeles, California

IN GOING over the statistics of the annual report of the Secretary of Agriculture some interesting data is presented with reference to the commercial value of eggs for the past five years.

These figures show that the average wholesale price for eggs in Chicago, for the year 1900 was 14½ cents; for 1901, 16 cents; for 1902, 20 cents; for 1903, 17 cents; for 1904, 20½ cents; for 1905, 22½ cents.

With the single exception of 1903, every year has shown a marked increase in the demand for eggs and consequently an increase in the average price. These figures show the increasing value of the poultry business and are markers for beginners in poultry work. It should be borne in mind that the poultry industry has not been overworked in the country. The supply has not been in excess of the demand. There has been no glut in the egg market for many years.

A largely increasing population creates a larger demand for eggs. And then, too, the people who live in cities and towns understand that eggs are cheaper than meat, and use them largely in substitute for that commodity. And the people who produce the eggs use more of them. Every condition which has made the price of eggs and poultry as meat high in the past, promises to continue long in the future, making the prospects for poultry and eggs better than ever before.

A Question.

A poultry dealer asked the question about Thanksgiving time, "Why is it that the price of eggs does not decline more in the country during the summer months." The answer is clear enough. The increased capacity of cold storage plants, where thousands upon thousands of cases of eggs are stored from March until winter. Competition among speculators keeps prices above what they would otherwise be. It is claimed that cold storage keeps the price of eggs down in winter. This may be true to a certain extent, but as a large portion of the hens of the country do not lay in winter the price of fresh eggs in winter is bound to be high enough always. The cold storage speculators buy when eggs are cheapest and when the price would be very low if the were not in the market. They secure to those people who would never get eggs in winter a price at least 5 cents in excess of the price they would receive under the old order of things. On the whole, cold storage is beneficial and has been the means of making the production of eggs more profitable.

Just now, as we in California are going into our winter, in fact are there, it is an important matter to know how to care for our birds in order to get the best egg product. In several of the eastern experimental stations this same subject is on trial. In Maine a number of breeds have been found to lay as high as 200 eggs in one year, and the results seem to indicate that by selecting and properly feeding the best layers for breeding purpose the average egg yield of a flock can be increased. This is done, of course, under strict test conditions, but it goes to demonstrate what may be done toward increasing egg supply where chickens are properly cared for. There are several things which may be done by every poultry keeper that will benefit his flock and not require an overexpenditure of time—where results will be obtained and consequently money saved.

Yield Wanted.

This is the time of the year when all successful poultrymen are trying to get a large egg yield, because when eggs are selling at from 40 to 50 cents per dozen it pays to give the hens good care and good feed. In selecting winter layers, pick out the long bodied, well devoloped females, and make their quarters as pleasant as possible. A dissatisfied bird is never a success. A house 16x10 is about the right size for fifteen birds. Such houses should be divided into two parts by means of a partition. Use one part for a roosting and laying room and the other for a feeding and scratching room. It is a good plan to have the floor in the feeding room covered with straw to the depth of six inches, but remember that the same straw should not be left in the house all winter long. It should be changed at least every two weeks and a weekly change is still better.

Regularity in feeding is one of the essential conditions to good egg results, almost as much as proper rations, and proper rations embraces such a wide field that a single article on that branch is necessary to properly cover the subject. Suffice it to say. hens need a variety of feed just as much as animals, or humans. They will never do well if fed continually on the same grain. They must have diversified articles. All the bulletins on this subject from the agricultural colleges, all the writers in the great farm papers, like Mrs. Basley, and others are pronounced advocates of frequent changes in poultry feed. Remember this: the essentials in successful poultry management are comfort, care and feeding.

Makes Hens Comfortable.

A successful poultry raiser was once asked what he did to make his birds always look fine as they did. He replied that he tried to have them comfortable every day from the time they were hatched until they left the farm. And this it has always seemed to us, is in a nut shell the secret of succesful poultry raising. If you will look around your neighborhood, no matter where you live, you will see that the best farmers are best poultry raisers; that is a branch of farming that always wins in the long run. If you can raise all the feed and grain that your chickens need, why do so, by all means, but don't neglect them while you are doing this, nor afterward. Better buy some from some less fortunate neighbor who has more feed than chickens. There are other things beside feed, too. Have you seen birds humped and shivering, day after day through the worst part of the winter? Did you think that those poor things were comfortable? Picture yourself in that condition and imagine how you would like it. We don't see how some men can crawl into a warm bed at night and sleep soundly until morning, while their live stock and poultry stand half frozen all night. Their feelings must be pretty well blunted. It doesn't pay in dollars and cents, either. Now, it doesn't cost much to fix up a comfortable shelter for poultry, when old straw can be had for almost nothing. When a man lets his stock of any kind suffer from the cold, it is a clear case of shiftlessnes. If this hits you, reform at once.

Prize-Winning
White Leghorn Cockerel

One of the hindrances of good egg production is:

Over Fat Hens.

Can hens be made too fat to lay? Ask one of your neighbors, and he will say that it is a fact, that it is possible for hens to put on an amount of fat that will effectually put an end to egg production. The neighbor on the other side of you will ridicule the idea. He feeds his hens all they can be made to eat, and yet gets more eggs than an acquaintance of his who is full of what he regards as the crazy notion that his hens must be fed sparingly if eggs in paying quantities are expected of them.

This is a subject over which there has been much controversy, and yet we are tempted to say that there is nothing to dispute about. Hens can be made too fat to lay by injudicious feeding at certain times of the year, and at other times they can safely be allowed all the food they will consume.

Everybody knows that hens lay very few eggs during the molting period. The majority of hens lay no eggs at all at that time. The hen is then shedding her old feathers and putting on a new suit for the winter. Her food at this time should largely consist of a kind which enters into the making of feathers. In other words, it should be food which is rich in animal matter. Nature has made provision for this in the abundance of insect food with which she has filled the fields and groves at this time. Hens that are given the freedom of the range will find a banquet all ready prepared for them which is exactly suited to their needs. If compelled to subsist upon this almost exclusively the molting process will go on very rapidly, and will be done with in time for early winter laying.

Heavy Feeding Injuries.

Heavy feeding with grain at this time will cause the hens to lay on fat very fast. Grain food does not contribute in any large degree to feather-making, and as the hens are not laying while the feathers are being renewed, such food does not enter into the composition of eggs. Consequently it is stored up in fat until the internal organism of the hen is so encumbered with it that it is a mechanical impossibility for her to lay. Such feeding makes the hens worthless as layers just at the time when they have reclothed themselves with a new suit of feathers, and ought to be in prime condition for the winter's work. The consequences are even more serious than this, as extreme fatness is the same in its effects as a disease, and leads to the "breaking down' or death of a large proportion of the flock.

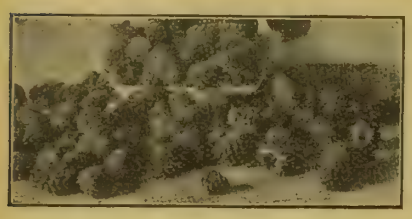
In the vast majority of cases these ill effects are brought about by heavy grain feeding during the molting period. When the hens have completed that process and have commenced to lay they can be fed what they will eat without risk, provided they are made to take a reasonable amount of exercise. It requires a considerable amount of food to meet the bodily demands of a hen that is laying an egg every other day, and it is next to impossible for her to be overfed at such times if anything approaching good judgment is exercised in giving her the variety of food suited to her needs.

Individual Preferences.

There are as many personal preferences in breeds as there are breeders. No special rule can be laid down to govern individual tastes. The great poultry shows this fall will furnish abundant opportunity for inspection and call out the votaries of the different classes of birds in advocacy of their specially showy points. Almost any breed will win if the owner likes it and cares for it as it should be cared for. But the best will fail if a slip-shod method is pursued in caring for it. So select the type you like best, study it and its peculiarities, and then adapt yourself to it.

There is as much success in adaptability as in knowledge, and above all the highest endowment and the most essential requisite is a good big bump of common sense. Poultry readers of The Cultivator, have you that bump? If not, you will waste time and dismally fail in the poultry business.

NEWBERT'S PHENOMENAL BERRIES



The most up-to-date berry on the market. They will clear you more money to the acre than any other berry you can grow. $750 clear profit has been made from one acre of these berries. The market price has been from 75c to $1.50 per crate of 16 half-pound baskets. I have taken ripe berries from my vines by the first of May.

Young Plants—I have for sale this year plants that I will guarantee will grow you large and healthy vines. **Prices**—I can furnish large orders on short notice. Price per dozen $1.00, per hundred $7.50.

My plants are rooted from the tips, and will make you a strong and fast-growing vine. Order at once to ensure delivery.

Deciduous Fruit Culture

By J. W. MILLS

Bud Destruction

WE ARE often admonished not to kill the birds. But there are birds and birds. There are some birds that should have every possible protection in all places, some which should have as much in one place and should be destroyed or kept down to few numbers in other places. The quail belongs to this last class. But there is the linnet. What good is there in it except its song. For those who do not have a family garden, he is good company and is always ready with a sweet song—provided your near neighbor has some fruit just getting ripe.

But it is not only the fruit that he destroys. It is in the bud destruction that he does the most damage. Should he only pre-empt your garden for fruit, it would be but a short time that you would have to watch him. It is only when the fruit is green that the small fruit grower is free from his depredations. When the leaves drop in the fall, he is at the fruit buds and will fill up the embryo blossoms twice a day. Apricots and almond buds are his favorite, but apple buds are used as a change of diet occasionally.

A man with a gun will keep them away if a regular patrol is kept up. Water poisoned with strichnine is the best remedy provided no other water is available for the birds. This placed in shallow pans sunk even with the surface of the ground and with some dirt in the bottom to make it appear natural will do the work. Put in pure water till the birds get the run of it for several days and then change it for poisoned water. It is useless to try this method except during periods dry north winds or during weather that goes with them.

FERTILIZING WALNUTS.

Many forms of fertilizer have been tried on this very profitable crop, but so far without much success. Horse manure, sheep manure and many different brands and formulas of commercial fertilizer. So far, chicken manure or guano has given the best results. Mr. Collins, vice-president and soil expert for the Agricultural Chemcal Works, Los Angeles, discovered in inspecting the walnut grove of Mr. A Miller at Los Nietos, that the walnut tree in which the chickens were in the habit of roosting and where their droppings were thick on the ground was particularly thick spurred, full of large leaves, bark, white and smooth, indicating perfect health. Mr. Miller, who has a beautiful grove, said he picked 250 pounds of nuts from this particular tree, and what is more important, has never failed to pick from two to three times as many nuts as from any other tree in the grove, all of which are the same age. Not being able to obtain sufficient hen manure to fertilize his grove, Mr. Miller had made for him a fertilizer composed of the same elements as chicken manure, in the same relative proportions, with which he has fertilized his grove, applying same when he sowed his peas for cover crops, using a drill specially made for the purpose. Needless to say these results will be watched carefully by many walnut growers.

AGE OF GRAPE VINES.

We were asked recently, how long grape vines will live and bear. This is something which we cannot answer with much satisfaction. However, they are known to retain their bearing qualities in this State for over fifty years as witnessed by the Carpinteria vine which bore something like three tons one season when it was about fifty years old. It has the advantage of being alone and can draw on an unlimited area. Muscat vines in the Sacramento valley, over thirty years old are still productive and profitable. Some of the old mission vines near San Gabriel were alive at 175 years of age under such trying conditions as would kill most plants.

To Cure a Cold In One Day.
Take LAXATIVE BROMO Quinine Tablets. Druggists refund money if it fails to cure. E. W. GROVE'S signature is on each box. 25 cents.

SUGGESTIONS ON PLANTING ORCHARDS.

There are many things to be considered in starting a fruit plantation but the following are among the more important: choice of varieties, selection, setting out, source, and care of the trees, the laying out of fruit plantation, the soil, and location.

The choice of varieties is very important and more so in the southwest when the question of injury from late spring frosts is considered. While more questions are generally asked upon this phase of fruit growing, the selection of varieties depends largely upon the personal perference of the grower, upon the purpose for which the fruit is to be grown, and upon the locality. In asking or giving definite advice about varieties one should have knowledge of these three elements and the grower should ask for specific information, such as, "What is the best commercial red winter apple or best late white European grape," instead of "What fruit shall I plant in my orchard.?"

In selecting varieties, so far as possible, select those you like best. Ascertain whether you want the fruit for desert, for canning, for the local trade, for shipping or for keeping purposes, also whether you want early or late ripening kinds. Choose the varieties best suited to meet your ideals.

Do not plant, at least on a large scale, a variety simply because it does well in another place, until it has proven its worth in your locality. Remember that varieties may do well in one section and poor in another. If a variety does very well in the east, it is likely that it will not do as well in the west. The matter of diversification in fruit growing must come to be more and more important, and any region should grow those varieties which do well there.

Varieties should also be selected with reference to the local environment. The adoption of the variety to the particular climate and soil, to the length of the season, to the system of cultivation, and irrigation should be considered. As a rule the finer the variety in quality the less likely it is to thrive well under diverse conditions.

The choice of varieties with reference to inter-pollination is now considered important. Many varieties are self-sterile, that is they do not produce fruit with their own pollen. This may be due, as in the case of the strawberry, to the imperfect flowers, and frequently to the pollen not being potent upon its own variety. If only seif-sterile varieties should happen to be planted, the plantation, other things being equal, would produce small crops. The unproductiveness of plantations due to self-sterility can be largely overcome by planting alternate rows of the different varieties.

In selecting the trees care should be exercised to secure first-class trees of the type of the varieties selected, and trees that are well grown, vigorous, free from disease or blemishes. The tree may be straight and smooth or it may be crooked and gnarly, all this depends upon the variety. Because a tree is crooked it is not necessary that it is a poor specimen. That may be characteristic of the variety. Buy first-class trees which are of medium size for their age, shapely, stocky and with abundance of roots free from disease, such as root gall or black knot. It is often thought that large size is of itself a great merit in a nursery tree. This is not always true. Vigor, and stockiness are more important than mere bigness.

The age at which trees are bought depends on circumstances and on the variety. Trees are bought too old rather than too young. Most apples and pears are large enough when two years old from the bud, while one year-old peach trees are preferable. Nothing is gained by planting the two-year-old peach trees in this section. The results at the Station with the one and two-year old peach trees have been in favor of the younger trees.

People often ask whether they

The Reed System

A PROSPECTIVE planter writes us that he wants to have the latest there is on the Reed system of planting orange trees. He has been informed that trees planted on that system require more water than trees which have been more sparingly watered during the earlier period of their life. Water costs money and if the trees do require more water if started after the Reed system, is it policy to start a tree on that plan.

We do not know that a tree started on the plan practiced by Mr. Reed will require more water than one started the usual way, if the trees grown under both systems are the same size at a later date when the item of water is a consideration. There is one thing certain, for one reason at least, the Reed tree will require more water than the other after the first year, both trees being the same age, and that is the former will be the largest. This is under ordinary circumstances. Under the ordinary system of planting, it is impossible for a tree to be as large at the end of the first year because it is not so large to start with and it is impossible for a tree to start and make the growth of the Reed and there it is that it falls behind again. At the beginning of the second year the ordinary tree is so far behind the other that it is a physical impossibility for it to catch up. At this time the Reed tree has some fruit on it, it has sent its roots out so that they about meet between trees and a vigorous rampant growth is spreading out in every direction. It requires more water than the other tree of course under these conditions, but the satisfaction and profit derived from such trees are worth more than the cost of the extra water. What do we raise orange trees for any way? Not to keep their growth and the profits down to a certain limit. We prefer the other view.

It is true that some of the best orchard managers put their young trees on a short allowance of water in order to tempt or draw some of the roots down to a deeper level where the trees may draw on the lower soil moisture and thus enable them to go through the dry summer with less frequent irrigations. We never have seen a case where this was practiced without loss in tree growth. It it pays to buy fertilizers to grow more fruit, it ought to pay to put on extra water to grow more tree in order that we may be compelled to buy more fertilizer to get a bigger crop the following year so that we may get more money to buy more water with to grow a still bigger tree with. This philosophy has been used by others.

In an experimental orchard that was planted at the Pomona station a few years ago, trees planted on both plans required no water at all during the second summer and there seemed to be no difference in the appearance of both sets of trees at the end of the season, except in size. These trees were planted in a fine sandy loam that is very retentive of moisture and during the twelve years in which the University had charge of the station clean culture was never practiced. No regular green manuring crop was planted, but all sorts of indigenous plants, among which were always several varieties of clovers and lupines grew regular every year. The soil was full of humus and with frequent cultivation after a season of abundant and late rainfall, no irrigation was required.

The Reed method of planting orange trees is as follows:

"Vigorous trees are selected in the nursery and well watered before removal. The longer branches are but slightly cut back, leaving most of the foliage on. The trees are then lifted and taken directly to the plantation where holes two feet deep and two and a half feet wide have been prepared, into which they are placed, and the earth is well filled around each ball, not firmed but settled with water so that the trees will stand at the same height as they did in the nursery. No planting should be done unless there is water for irrigating available at the time. After the ground has been soaked for several feet on all sides of the newly set tree, thorough cultivation should follow as soon as the land is in proper condition.

A small amount of fertilizer is applied soon after planting, for the new roots to use when they first start out from the balls. A pure bat guano with a high percentage of nitrogen, about three quarters of a pound to the tree, has been found to give the best results, but any commercial fertilizer rich in nitrogen or animal fertilizer, if placed properly and kept moist, answers well. It is applied in trenches each side of the ball, at right angles with the irrigation ditches and reaching to them. They may be made by plowing a deep furrow and deepening with a shovel to ten or twelve inches. This is carefully distributed and slightly mixed with the earth at the bottom of the furrows; water from the irrigation furrows keeping this always moist, it is available as soon as reached by the rootlets. This also tends to deep rooting. Thorough irrigation should follow planting every twelve or fifteen days during the first summer. The whole space between the rows should be thoroughly and deeply wet, not merely a narrow strip on each side of the rows. I have traced roots that have grown during the first summer, over six feet from the tree, and these should be well supplied with moisture at all times." The above is quoted from Mr. Reed as given to us.

ORANGE CULTURE.

Though taking its inception in the warm belt of the Southern counties of the State, citrus culture has gradually found its way farther north year by year, until at the present writing, oranges and lemons are successfully grown within the very shadow of Mount Shasta; in Arizona, notably the Salt River Valley, and in many portions of Old Mexico. The sheltered nooks and interior Valleys of the Sierras, the thermal belts in Placer, Kern and Tulare counties, the regions free from biting frosts in the great valleys of the San Joaquin and Sacramento, all furnish conditions of soil and climates in which the orange and the lemon luxuriate.

Planting can be done from February to August, but preferably during the early Spring months. Distance apart is somewhat governed by varieties. The Dwarf can be planted as close as 10 feet, the budded varieties 24 feet, and the seedlings, 25 to 30 feet. Thorough cultivation and judicious irrigation are essential to best results. Trees should be trained to form a symmetrical head, hence pruning is somewhat limited to cutting out the dead wood, interfering limbs and suckers. The Lemon requires more severe treatment, owing to its scraggly growth; the treatment given the average deciduous tree, possibly not quite so severe, will be found about correct.

IRRIGATING TREES.

Water is probably the most important factor in the success of growing trees. Most of the failures in starting shade trees seems to be due to the insufficient amount of water the trees get. Immediately after the tree is planted it should be thoroughly watered or irrigated, especially if the soil is dry. In about twelve to fifteen days the trees should be irrigated again and in about a week thereafter, or as soon as the soil begins to dry, it is well to go over the trees and pack the soil around them, which tends to crack open. The subsequent irrigations should be frequent, at least, till the trees becomes well established. This is especially important in the case of deciduous trees.

The actual shipments of oranges for last season from Southern California were 22,175 and 3788 cars of lemons. The lemon crop promises to be quite a little larger than last year and our estimate on both varieties of citrus fruits is as follows: Oranges, 22,000 cars; lemons, 4200 cars.

Who waits until the wind shall silent keep
Will never find the ready hour to sow;
Who watches clouds will have no time to reap.

When writing advertisers mention Cultivator

200% INCREASE

From The Los Angeles Times, Nov. 23, 1906:

"Truman Berry has just completed the picking of ***lemons*** from a four-acre East Whittier orchard, getting over 1200 field boxes from the four acres. This is considered something of a record, as the orchard was gone over thoroughly just one month ago. The average yield per acre is something like 100 field boxes for each picking, this being considered a good record. Berry's record is therefore ***three times the average yield*** and goes to show how California soil will repay careful and intelligent effort on the part of the rancher."

Butter Making

WHERE a large number of cows are kept the irregularities of the individual cows are little noticed. The large dairyman is often surprised at the things the man keeping two cows tells him about, for instance, the way certain feeds act. He had not discovered that there was a wide difference between his cows at all As a rule the large dairymen feed too little, and the keeper of a couple of cows over-feeds them. Nearly all the cow stomach troubles that come to me through the Cultivator are cases of over-feeding. No feed will increase the natural capacity of the cow, when she is up to her limit the rest of the food is simply wasted.

Food does not directly affect the butter produced. The amount of milk produced is dependent on the character of the feed to this extent, that succulent feeds like grass and corn silage, make a larger flow of milk and as the milk increases the butter fat carried by it is also increased. In other words, increasing the amount of milk produced not by making the milk richer, or of higher per cent. of butter fat. The man who thinks that cows give the same per cent. of fat at all times is also greatly mistaken. They average it, even in the most regular milkers there occurs unaccountable rises and falls in the amount of fat produced from day to day. A cow gives the largest flow for three months of the lowest per cent. and then steadily the per cent. of fat rises as the flow diminishes, a cow starting at three per cent. will be apt at the close of her milking period to give as high as five and a half per cent.

Farm Butter Making.

In the large dairy the milk from the fresh cows is mingled with the milk of those going dry—one offsets the other in the mingled cream—a separator is in use, the cream is evenly ripened in a larger mass and the churning is easily accomplished in thirty minutes. The farmer's wife finds making butter a different matter from this, as she has to struggle along in all sorts of unsuitable places without conveniences. Now I want right here to say that the ordinary work of a butter maker in a creamery is not as hard as women are doing every day in California. I should like to see some girls in the dairy school at Berkeley, there is plenty of work in the private creamery where 200 cows are kept to give a woman work that is well paid and suitable to her strength. The modern appliances make it easier to run and easier to clean than one's kitchen. The ordinary engine and boiler in use is not any harder to understand than the kitchen range and sewing machine, these no one doubt that a woman can run all right.

In California during the rainy season, the farmer's wives find it almost impossible to keep the milk pans in a place of suitable temperature. Bacterial growths are rampant all around. I found yesterday my best kid gloves that laid away in a room without fire, were spotted with mildew. The right temperature, a want of fresh air and a floating spore for seed had ruined the gloves.

Now when the warm milk comes in it is strained into pans and placed in a room where the temperature is about fifty-five or a little less, the natural souring produced by the lactic acid bacteria life action in the milk, is checked and some of the "forty-nine" wrong kinds that should not be developed start up into life; the cream rises already charged with them and they are stirred into the cream jar and more and more develop until they reach into billions and the entire batch of cream is tainted.

Worse than all this is that everything the cream comes into contact with will be tainted, and require to be made antiseptically clean before the spores are gotten rid of.

First Care With Cow.

The first care must begin with the cow she must have wholesome food clean water and a dry bed. She must be clean, if her back and thighs are plastered with manure, it will be hard to have sweet clean tasting butter. If she is in this condition, use the first bright day to soak off the dirt with water and then clip the hair close on the legs and udder. If you can borrow a horse hand clipper the work will be easier. A pair of sharp scissors will do the work if you have a comb to cut against. Then provide a dry place for the cow to sleep. If the stable has only a dirt floor it will only take a few wheelbarrows of dirt to make a reasonably clean place for her to lie down on. A four-foot stick of oak fire-wood if there is no sill behind her, will answer better than nothing. Place it so that it will raise her stall up, stand her in the stall and find how long the stall should be, then place the sill so her hind feet will rest on it when she stands up to the manger, then fill in with earth in front to the top of the sill and wet it and tamp it a little. On the outside of the sill drive down some sharpened stakes to hold the sill in place, and then dig a gutter a little deeper than the passageway, about ten inches wide at the top and sloping to five inches at the bottom and five inches deep now if the cows' filled-in stall stands four or five inches above the floor of the passage the gutter will be deep enough to hold considerable droppings the height of the sill will lift her hips when she lays down above the manure and she will stay clean.

The best deoderizer is gypsum or land plaster, but fresh dry earth will answer if this is put into the gutter when it is cleaned and removed every day. The liquid manure will be absorbed by it and saved to use in the garden. Now where the cow is not in stanchions it may be necessary to shorten up her chain to keep her clean but make up your mind once to have her clean and the way will solve itself. Keep her clean if you hope to keep the badness out of the milk and cream. I read the following somewhere, I hope it was not in the Cultivator: That in an experiment with milk, a sample was milked and held under antiseptic conditions. The milk was tasted by a committee of three, it was known to be pure, yet they all agreed it was not good. The expert tried again and again, to have the milk taste right but he alway

Knowledge— not guesswork

Dr. Hess (M.D., D.V.S,) who formulated Dr. Hess Stock Food is a regularly licensed Doctor of Medicine and a Veterinary Surgeon. He is a graduate of the University of Wooster, Cleveland, Ohio; Matriculate of College of Physicians and Surgeons, Baltimore, Md., and a graduate of the Chicago Veterinary College, and in addition is a practical stock feeder of many years' experience. Dr. Hess Stock Food is a medicinal food prepared from a highly successful prescription used by Dr. Hess in his many years regular practice before the food was put on the market. It requires only common sense to see that unprofessional manufacturers cannot equal a preparation formulated by a practical physician and based upon accurate knowledge, long experience and observation. Furthermore,

DR HESS STOCK FOOD

A TONIC

FOR CATTLE, HOGS, SHEEP AND HORSES

is sold under a positive guarantee to do all that is claimed for it. It contains tonics for the digestion, iron for the blood, nitrates to expel poisonous materials from the system, laxatives to regulate the bowels. It has the recommendation of the Veterinary Colleges, the Farm Papers, is recognized as a medicinal tonic and laxative by our own Government, and is **sold on a written guarantee at**

100 lbs. $7.00. 25 lb. pail $2.00

Smaller quantities at a slight advance.

Where Dr. Hess Stock Food differs is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our Government recognizes Dr. Hess Stock Food as a medicinal tonic and this paper is back of the guarantee.

Veterinary advice given free. From the 1st to the 10th of each month by naming this paper, stating what stock you have and what Stock Food you have fed, we will furnish you free veterinary advice and prescriptions. Enclose two cent stamp for reply. Dr. Hess 96 page Veterinary Book will be mailed free for giving the above information.

DR. HESS & CLARK, Ashland, Ohio.

failed. Then in disgust he took a pinch of dry manure from the gutter of the cow barn and stirred it into the milk afterward straining it. Again the set of samples were tasted and all pronounced flat until the last was reached, this was said to be fine. Needless to say, it was the sample flavored with extract of stable filth. Where one is accustomed to the milk of a number of cows they dread the taste of one cows milk, knowing that it will be apt to be "cowy." Try tasting the milk on the table critically. Milk is a mild, almost tasteless fluid, slightly sweet and should not taste at all like a cow stable smells.

BUTTERMAKING ON THE FARM.

Fred Rasmussen of the Iowa Experimental Station, in discussing the subject of butter-making on the farm says that on account of lack of uniformity in flavor, color or salt, the grocer to whom the bulk of farm made butter is sold, is unable to dispose of it for private consumption, but sends it to the renovating factory where it is worked over, purified, made up into uniform packages and again put on the market.

Farmers in California suffer the same loss in price for inferior butter as do the farmers of the middle West. They are compelled to take less for it because of its inferiority, often having to exchange it for merchandise at the store receiving about one-half its selling price after it has been renovated at the factory. The renovator is the only party who makes a profit on this butter, as he is able to hold it in cold storage either before or after it is remelted, and thus put it on the market when butter is scarce. It then often sells for only a few cents less than creamery butter.

This should not be so, for the farm, in many respects, is an ideal place for making butter, because full control can be had of all the essential steps involved, from the milking of the cow until the butter is placed upon the market. It is understood that condition and equipments are often poor, but, if it is desired to continue to make butter, it will pay to improve the conditions so they will become more suitable.

Care of the Milk.

The care the milk and cream receives before churning will determine the flavor, says Mr. Rasmussen, which is the most essential quality of butter, as it is used more as a relish than as a food. Faults that butter may have, aside from flavor, are all due to carelessness or lack of skill in the process of making. If the underlying principles of butter-making are understood, it is not a difficult problem to make a uniform grade of butter from day to day. As long as the agricultural and dairy papers, dairy schools and experiment stations answer free any inquiry, and can explain the cause of most difficulties, there seems to be no excuse for making so much poor butter on the farm. It takes the same labor to make spoiled cream into butter and do it without paying attention to temperature, overchurning, proper working and salting, as it does to churn well-ripened cream and do it in an intelligent way. The difference is that in the latter case about twice as much per pound of butter will be received, and butter-making is made a paying business.

Intelligence Needed.

There never was a time when so great a premium was paid on intelligence as there is today. Many people have enough money to buy good commodities, and for such there is a strong demand, even at high prices. Especially is this true of farm produce. Near every town invariably there are some people who receive more for their goods than do others. The main reason is that those people deliver a uniform product, an article that is always up to the standard, put up in a neat, attractive way. It is marked by an individuality for which the consumer is willing to pay. There is an unwritten guarantee with such an article. The producer established a reputation by skill, intelligence, and honesty. He knows that to try to put out an inferior article under the special brand would be folly, as the small temporary gain would be insignificant compared with the loss it might bring in the future.

Attractive Form.

Like Mrs. Sherman, the writer holds that next in importance to making a uniform grade of butter is to put it up in a neat, attractive way, and bring it to the consumer's attention. This can be done by putting up the butter in one-pound prints, neatly wrapped in parchment papers, upon which is stamped the name of the farm or a special name under which the butter is sold. A great deal can be done to distinguish the product by some attractive feature. It should be something catching, suggestive, easy to remember, so that thinking of butter, a certain name or picture that has been seen once in such connection readily presents itself to the mind.

Butter should be made so that there is no necessity for making it over. The fewer middlemen between the producer and consumer, the greater the profit to the producer. Interurban roads are being planned, and built in all parts of the country. This means increased shipping facilities, which enable the farmer to profit by the demand in the city for unformly good farm produce. If better methods of making and warketing farm butter are applied, the present amount of renovated butter will be a thing of the past and the money it takes to operate the renovating factories and their profit will go directly into the farmer's pocket.

But this condition can only be reached when the farmer is brought to understand that his butter must be made as good as the creamery product both in flavor and in form. "Anything worth doing is worth doing well," and when this fact is applied to country butter-making, the farmer will be in position to receive the profit which the factory now obtains.

Queries

Kicking Cow.

Will you tell me how to cure my cow of the kicking habit. She is young and somewhat vicious. B. P. E. —Glendora.

Here is what Hoard's Dairyman says on this subject.

"We read of all sorts of devices to cure kicking cows. Like balky horses, kicking cows are usually made so by the men who handle them. The best device we have ever seen is to put a ring in the floor overhead and with a halter on the cow draw her head up pretty taut. She can not kick very well in this position, and the beauty of it is she does not know what it is that prevents her, as she soon comes to know if a strap is buckled about her legs."

Tying Cords.

Please give me some method for tying cows in barn. Will cows raised on the range do well if tied in barn? D. A. W., Hynes.

The cow, range-raised, does not take kindly to stanchions. We had strong round poles placed upright in pairs between each cow and against the mangers. On these iron rings that moved easily up and down were placed, a short chain connected the ring with the chain on the cows neck, she was tied from both sides with about four inches of play in the side chains, this allowed her to move that much to each side as well as that much back from the manger, when she laid down the rings dropped down and when she got up they rose with her. The side chains must be short or she will get tangled by putting her front foot over one of them.—M. E. S.

Churning.

I cannot get butter from the last three churnings. Have tried a higher temperature than 62, soda, salt and lime water all to no purpose. Is there no remedy for the gas in the cream which makes it foam? The cow has been fresh since August; is in good condition, with stable and dairy utensils kept very clean. She has been fed upon dry alfalfa until lately, when it has been mixed with oats and barley hay.—M. E. B. G.

The remedy for gas is not to allow it to form in the cream. In California at this season of the year this is not easy to do. I used to manage mine in this way, add a quart of hot water to each pan of milk holding a gallon or at the rate of a quart of water to a gallon of milk. Set the pan in a pan of

hot water put both on the fire and when it reaches the temperature of a hundred or when the edges are just crinkled a trifle, remove and put in a cold place, this helps the cream to rise quickly. After thirty-six hours skim the cream off. Stir the cream into the jar of cream thoroughly. Before churning take the cream jar and stand it in a pail of hot water until the cream reaches eighty degrees, stir it so that it will be evenly heated adding hot water to the container when necessary. It will take about three hours to raise the cream to this temperature, keep it covered taste it and hold it warm until it develops a slightly acid taste and the smooth look of ripe cream then chill it as rapidly as possible. When at fifty-four it can be churned at once or it can be chilled down to as low as possible, and held for ten hours. It will then have to warm up to fifty-four. Churn slowly and the butter should come in twenty minutes. When the size of grains of wheat run off the buttermilk and add water, turn a few times slowly and then run off the water, add the salt and turn again to mix it in, take up, work it and make into rolls. If the butter is carefully handled it will be found unnecessary to work it twice, the secret is to wash it with water the same temperature as the butter and then to sprinkle in the salt carefully before taking it up.—M. E. S.

Facts For Stockmen.

No combination of figures or long line of cyphers, can give a just idea of the colossal proportions of the cattle industry as carried on by American farmers and ranchmen.

Statistics of a year or so back tell us that 17,000,000 cows and more than 43,000,000 other horned cattle, roamed the great ranges of the West, or fed in farm yard and stable in every State in the Union. All this stock reaches a total valuation of one thousand three hundred million dollars—figures too large to get hold of with any clear comprehension. Now, in view of the immensity of this great business, what would it become in the future if all needless waste were eliminated? For there is waste, enormous and useless. Cattlemen are just beginning to realize how much has been lost by lack of system and the happy-go-lucky methods of a past generation of great cattle kings, and how great a loss there still is today in every stable and on every farm. Success now depends upon economical methods—not on the thousands of head a man counts in his herds. Every pound of hay or grain is carefully reckoned with in these days, and the individual animal required to return the greatest possible growth or increase for the outlay. To further this desired result, knowing feeders give Dr. Hess Stock Food in small doses twice a day, because experience proves its great value as a digestive tonic and flesh builder. Common sense tells us that an animal in confinement is surrounded by unnatural conditions. When such conditions are made still more unnatural by the use of dry feed, nature must be assisted in her struggle for a proper balance and action of animal functions. Dr. Hess Stock Food maintains this balance and activity of the animal economy by so assisting and strengthening the digestive organs that the maximum amount of nutriment is assimilated and converted to growth, fattening, or secretion of milk. That Dr. Hess Stock Food actually accomplishes this desired end is abundantly proved by the unsought testimonials of thousands of successful feeders, and by the endorsement of the Agricultural Department at Washington. Furthermore, Professors Quitman, Winslow and Finley Dun—acknowledged authorities on such subjects—state that bitter tonics, iron for the blood, and nitrates to expel poisonous matter (all of which enter into the composition of Dr. Hess Stock Food) are essential in maintaining the highest degree of animal health and efficiency. With such abundant proof of actual value, farmers everywhere are turning to Dr. Hess Stock Food as the one thing necessary to put the feeding business on a paying basis. By its aid the margin of profit, sometimes so narrow as to come dangerously near actual loss, is increased till a year's operation shows a substantial balance on the right side of the ledger. Bear in mind, then, that nothing "tones up" a feeding animal, gives such good health and increased appetite, as Dr. Hess Stock Food.

A little twice a day in grain rations solves the feeder's most serious problem, and places his business in the front rank as an agricultural stand-by.

Cream Separators, all sizes, all prices. See O. J. Weber Co., 558-557 So. Los Angeles St., Los Angeles.

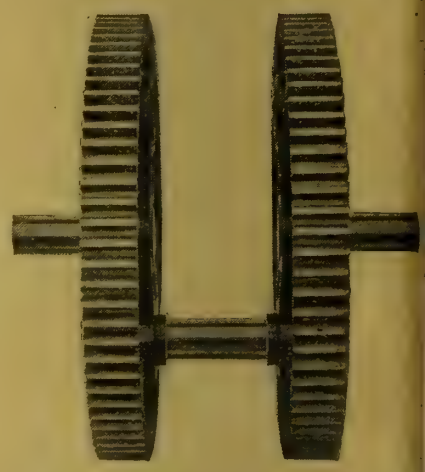
The Pomona Pump



The pumping season of 1906 is now drawing to a close, and the Pomona Manufacturing Company of Pomona have installed and have in successful operation some of the largest deep-well pumping plants in Southern California, among which are the following:

Santa Anita Land and Water Co.
40 Horsepower
Artesian Belt Water Co. of San Dimas
40 Horsepower
San Dimas Irrigation Co. of San Dimas
40 Horsepower
Western Watern & Power Co., Glendora
50 Horsepower
Irvine Company of Santa Ana
30 Horsepower
E. J. Baldwin Ranch 40 Horsepower

And for next season they are preparing to turn out cylinders of larger diameter and power-heads up to 60-H.P. capacity.

The new catalog for 1907 will be ready in a few weeks, and they will be sent free to any one interested in deep-well pumping.

Orchard Planting

Continued from Page 4

should plant dwarf or standard trees. Growing dwarf and standard trees take in two types of fruit-growing and the intending grower should study both types thoroughly and decide according to circumstances. It may be said, that as a general rule, the standard trees are more reliable and on the whole better. The dwarf trees do not seem to be so vigorous, requiring extra care and are not as profitable. For family orchards the dwarfs can be grown advantageously but for large commercial plantations the standards are better.

"Where can I buy fruit trees, and do trees from the north, east, south or west do best in this climate?" These are questions frequently asked by orchard planters in the Territory. The question of the source of trees is one that attracts considerable attention and bears some relation to the planters local conditions, which at present, can not be definitely answered for New Mexico. This question involves a numebr of things, such as the manner of growing the nursery stock, the distance shipped, the way they are packed when shipped, and the treatment of the tree when received. Apparently there seems to be no material difference in the growth of the tree on account of its source, if it has been well grown, well shipped and well taken care of when received and well started. As a general rule, however, if all these conditions be equal, the home-grown trees or those grown nearest you are the best.

FABIAN GARCIA.

New Mexico.

PLANT FOOD FOR FRUITS.

Recent experiments made by the New York Experiment Station show that peach trees are the heaviest users of plant food when peach, apple, pear, plum and quince are compared. Apple and quince are about alike while plum and pears are near together and come in the third group.

Each variety of tree takes about the same proportion of each kind of plant food, but vary in quantity of the whole. Taking nitrogen as a unit the comparison is about as follows. Nitrogen 1, Phosphoric acid .27; Potash, 1.14; Lime, 1.35; and Magnesia, 0.45.

The amount used per acre at the New York Station was determined to be about as follows. Apples, 35 trees per acre; nitrogen, 51.5 pounds., peach, 120 trees per acre, 74.5, pear, 120 trees 29.5; plum 29.5; quince, 240 trees per acre, 45.5 pounds per acre. Phosphoric acid:—Apple, 14.0 pounds per acre; peach, 18.0; pear, 7.0; plum 8.5 and quince, 15.5 pounds per acre.

Potash:—Apple, 55.0 pounds per acre, peach, 72.0; pear, 33.0; plum, 38.0; and quince, 57.0 pounds per acre.

Lime:—Apple, 57.0 pounds per acre, peach, 114.0; pear, 38.0; plum, 41.0 and quince, 65.5 pounds per acre.

Magnesia:—Apple, 23 pounds per acre, peach, 35; pear, 11; plum, 13 and quince 19 pounds per acre.

It was found that the fruit removed from an acre of land, the following amounts of material in the order named above; nitrogen etc., 16.5 pounds; 7 pounds; 32.8 pounds; 3 and 4.4 pounds respectively.

The leaves removed from an acre, 26 pounds, 4.6 pounds; 16, 49.6 and 14.3 pounds respectively.

The new yearly growth removed from an acre 3.2; 1; 2; 10.4 and 1.5 pounds respectively.

This will give some sort of an idea as to how these various fruits may be fertilized most economically. The leaves are largely returned to the soil and so are the elements contained in the prunings, except the nitrogen, if the ashes are returned to the orchard. Little need be taken into account except the fruit.

STRAWBERRY FERTILIZATION.

Now is the time to plan the years food for your plants and trees. In fact it is "feeding time" so far as the phosphoric acid and potash are concerned. The nitrogen can be given partly later in the season, after the spring growth starts. If we are thinking of looking toward the production of fruit, potash should be given a prominent place in the ration. Failure to get satisfactory results from the use of plant foods often arises from neglecting to give separate consideration to the plant and the fruit. While the fruit demands a liberal use of potash, we must first produce the plant, and in this preliminary work a smaller portion of potash, and relatively more nitrogen and phosphoric acid are required. For instance if the strawberry grower desires to get berries he must first make vigorous plants with abundant foliage. His second object is to make these plants bear a crop of fruit. Foliage makes great demand on nitrogen. Fruit requires liberal supplies of potash. The rational fertilizing of strawberry plantations is essentially the practical application and proper relation of these two facts. It should not be inferred that either of these two essential plant foods alone will produce satisfactory results on the portion of the crop to which it is especially adapted. Both are indispensible to the normal growth of each part of the plant, but each possesses special relations to the development of a single part of the strawberry plant, and the proportion of the two materials should be varied to meet the requirements of each of these parts at the time when the development of this part of the plant is the chief work of the plant.

The long seasons of growth before fruit production begins renders the division and proportioning of the fertilizer applications sa as to meet these separate requirements entirely feasible. This division of the total application of fertilizer has a further advantage. Nitrogen is not only the most costly ingredient of all fertilizers, but it is also the one most subject to loss in drainage waters. In sections where the ground is not thoroughly frozen during the winter, but is subjected to heavy washing rains during this season, all nitrogen in excess of the immediate requirements of the plant is exposed to the danger of serious waste before the excess can be used by the crop. Excessive early applications of nitrogen, moreover, are accompanied by a further disadvantage. Too much nitrogen in the fall or early spring, increases the danger of setbacks from freezing. Liberal amounts of potash, on the other hand, increase the hardiness of the plants, and diminish this danger.

Another property of these two plant foods is of special importance, as related to the character of the fruit produced. Excessive nitrogen tends to produce soft berries. Liberal potash fertilizing tends in the opposite direction, and increases the shipping quality of the fruit. With these controlling facts in mind, the proper and economical fertilizing of the strawberry crop is comparatively simple.—Geo. Wright.

Supervisor John W. Ballard of Carpinteria has the banner bean farm of the State. Not in acreage, but in the amount yielded per acre. Mr. Ballard has a forty-acre tract in Carpinteria and this year it yielded more than a ton and a half to the acre of common lima beans and it is said that the forty-acre tract returned about $4000 net to its owner.

The entire crop of fruit of this year shipped from Anderson consisted of fifty carloads green Bartlett pears for the East; fifty of the same for canneries. Thirty-eight hundred tons cured prunes, 130 tons dried Bartlett pears have been packed and shipped by the two dried fruit packing-houses of this place. This output to the growers realized them in return $400,000, Anderson being the shipping and distributing point for the bulk of the horticultural and agricultural products grown in the farming and stock-raising part of central and southern Shasta county.

Stepnen Strong, Chairman of the Los Angeles county Horticultural Commission, and one of the ablest ever occupying that position, has received a special appointment from the United States Department of Agriculture to proceed to Florida as a mission ary of fumigation to teach the native Floridan how best to control orchard pests. He left Los Angeles, Dec. 31st, 1906.

The Vegetable Garden

By ERNEST BRAUNTON

The Melon Aphis

THE melon aphis, or, as it is commonly known, the "melon louse," injures plants by piercing them with its beak and sapping their vitality. It occurs from early spring to late in autumn on melons and other cucurbits of all kinds, and on many other crop plants, and in seasons which favor its increase, notably in summers following springs that are cool and rainy, it frequently develops in enormous numbers and does very serious damage, collecting in masses on the under surface of the leaves of plants and causing them to curl, shrivel, and lose color, and interfering with the ultimate development of the fruit. Often it kills plants outright, and destroys whole fields or greatly reduces the yield of fruit.

The melon aphis, like others of its kind, excretes "honey dew," but this is not so copious as in the case of many species of aphides, for example, certain forms which affect trees. When, however, the aphis under discussion becomes unusually abundant, the honey dew covers the leaves of the affected plants with a thin, sticky coating on which the white cast skins of the aphides adhere, and this attracts attention to injury, as does also the wilting and dying down of the plants. Some persons notice this honey dew, and are aware of the presence of the insects. They speak of the injury as "honey dew,' 'and have even applied this name to the insect itself.

Quite too frequently, by the time the presence of the melon aphis in injurious numbers is noticed, irreparable damage has been accomplished and the insects have for the most part migrated to other pastures.

TRANSPLANTING ONIONS.

One of the principal things in view in raising onions is to produce a large yield; and in order to do this, all of the soil must be utilized to the best advantage. Most of the onion growers allow too much land to each onion. Ordinarily, the onions are planted about twelve inches in each direction and in this way the land is not made to produce all it can. The most common distance, where "hand culture" is practiced, seems to be from twelve to fifteen inches between the rows and from four to four and a half inches in the row. Setting the onions out at these distances gives a larger number to the acre, varying from 100,000 to 120,000 onions or more. On the other hand, if "horse culture" is employed, the distance between the rows is usually increased to at least thirty inches, thus reducing the number of onions to the acre.

FAILURE WITH MUSHROOMS.

Success in mushroom growing depends on intelligent study of conditions and on experience. While many American growers have been successful in the production of mushrooms, a much larger number have failed. In most cases their failures have been due to one or more of the following causes:

(1.) The use of poor spawn, or of spawn which has been killed by improper storage.

(2.) Spawning at a temperature injuriously high.

(3.) The use of too much water either at the time of spawning or later.

(4.) Unfavorable temperature during the growing period.

POTATO DRY ROT.

This disease is caused by a fungus, Fusarium oxysporium, which growing in the stem causes the plants to gradually dry up and die. The disease is indicated by the lighter colored and more or less rolled up leaves. When dug the potatoes may appear sound, but internally show black or brown streaks, and later are destroyed at least at one end by the dry rot.

The fungus may remain in the soil for a long time, and badly affected land may have to be abandoned for potato growing for several years. The affected tubers should not be used for seed.

Nervous Passenger (during thunderstorm)—Ain't it dangerous to be on a street car when it's lightning so?

Calm Passenger—Not at all. You see, the motorman is a nonconductor.

One time a pale student from Ga.
Was pinched for being a fa.
Said the judge with a smile:
"Young man, for a while
Free of charge we are going to ba."

HOW FROST IS FORMED.

The atmosphere of the earth always contains more or less moisture in an invisible form. When at a considerable elevation above the earth this moisture, or aqueous vapor, is condensed, clouds are formed; when the process of condensation is more active and the temperature of the air is above freezing, rain falls, and when the temperature of the air is below freezing, snow is produced. When the moisture of the air in immediate contact with the earth is condensed at temperatures above freezing, dew is formed; when at temperatures below freezing, frost is deposited. Frost is, therefore, the moisture of the air condensed at freezing temperatures upon plants and other objects near the surface of the earth.

PROPAGATION.

The propagation of plants is their reproduction by natural or artificial means. A knowledge of these means is of great importance to agriculturists of all classes, and especially to those engaged in the various branches of horticulture. There are, for instance, so many benefits to be gained by the local production of nursery stock that fruit growers of a developing region cannot afford to neglect this art. The introduction of dangerous pests can be avoided, scions and buds from trees thoroughly acclimated can be obtained, the young stock will not be forced to suffer the shock of long transportation and a change of climate, and last, and by no means least, the orchardist can have his trees grown from scions or buds from his favorite trees.

Woodman, spare not that tree;
Cut every single bough.
If ever we needed wood,
We certainly need it now.

SOW WESTERN SEEDS IN WESTERN SOIL

Here's a SPECIAL OFFER to make New Friends for LILLY'S Northern Grown Seeds

LILLY'S BEST Vegetable seeds are grown on and adapted to this coast. These 10 varieties are the aristocrats of the kitchen-garden. They represent the acme of Lilly effort, the result of years of careful seed selection and cultivation. This Special Offer gives you $1.50 in these seeds for $1.00. Read the descriptions, all of which are carefully and conservatively made. Living up to the catalogue description is what has built up the reputation of Lilly's Best Seeds.

PUGET SOUND SPECIAL TOMATO.

This miniature, from a photograph, gives you an idea how the tomato produces. Is an early dwarf, stands free from the ground, with hard, firm, round stalks. Yields large clusters of round, firm, luscious fruit, beautiful rich color, free from blemish, stands shipment splendidly. A three-season leader; popular everywhere. Perfected by us on our experiment grounds at Brighton Beach, and can be obtained solely from us. Sold only in sealed packets. Ounce, 60c; packet, 10c.

GOLDEN JERSEY WAX BEAN.

Brittle, tender, broad, thick—the best of all the yellow pod bush beans. Stringless. Beautiful golden color and delicious flavor. Vigorous, reliable, and an abundant producer. ¼-lb., 25c; packet, 10c.

JACK FROST SWEET CORN.

Plump, milky kernels, that melt in your mouth; tender, sweet, prolific—really phenomenal. Dwarf variety, permitting close planting. Very hardy. Jack Frost seed has been perfected by ourselves on Puget Sound, is thoroughly acclimated and peculiarly adapted to Pacific Coast conditions. Not only season's earliest, but longest and latest producer. We cannot say too much in endorsement of this corn. Large packet, 15c.

LILLY'S GLORY CABBAGE.

Glorious in flavor, gloriously sound, a glorious grower and a glorious shipper. Lilly ships tons of this cabbage seed across the continent, as this variety, perfected on Puget Sound, is admitted to be the best cabbage grown. Even rounder and more solid than the Danish Ball Head, and infinitely better adapted to Pacific coast conditions. True to type, every head like its neighbor, symmetrical, white inside and solid to the core. ¼-lb., $1.25; 1-oz., 35c; packet, 10c.

PRIDE OF THE PACIFIC CUCUMBER.

Almost a seedless cucumber, the seeds being small and few. Perfectly smooth, very dark green, beautiful white flesh, perfect cucumber flavor, exceptionally firm, crisp and delicious. Grows 10 to 18 inches long, always straight, and dark green until ripe. Vine hardy and vigorous; enormously productive; yields early and late in season. ¼-lb., 65c; 2-oz., 40c; oz., 25c; packet, 10c.

ENGLISH FORCING LETTUCE.

Large, crisp, tender; best variety for home culture, because easily grown outdoors or in frames; rich color, ideal for garnishing. Hotels gladly pay one-third more for this lettuce. Stands more neglect in watering, and does not quickly run to seed. Most profitable for market purposes because quickly ready in fine large bunches of beautiful light green, which never spot. ¼-lb., 50c; oz., 20c; packet, 10c.

MT. RAINIER PEA.

Dark, rich green, well-filled pods, creamy and delicious; enormously productive. Propagated in Washington, and the best early pea ever offered to western growers. Especially valuable for market gardeners, commanding the highest prices through the season. Large packet, 10c.

CRIMSON GLOBE BEET.

Close grain flesh, very sweet, tender, blood red, delicately zoned with white. Exceedingly smooth surface. Finest in form, flavor and color. Free from woody, fibrous roots. Grows uniform in size—about three inches through. Matures early. Pkt., 10c.

GOLDEN HALF-LONG CARROT.

Best of all the yellow varieties. Very sweet, close in texture, golden yellow, solid, very smooth, attains large size, has small core, and adapted to all soils; under good cultivation yields 25 to 30 tons per acre. Ready for table at all times during growth. Equally valuable for stock. A market favorite. ¼-lb., 25c; packet, 10c.

CRIMSON GIANT RADISH.

The larger it grows the solider it gets; twice the ordinary size. As hard as a bullet, white tender and deliciously crisp. Retains goodness long after maturity. ¼-lb., 40c; packet, 10c..

SPECIAL PRICE OFFER.

$1.50 worth of above seeds for $1.00.

$1.00 worth of above seeds (one packet of each variety, with packet of Old Fashioned Flower Garden Seeds thrown in free) for 75c.

Six 10c packets, with Flower Garden packet, 50c.

Three 10c packets, 25c.

Above prices are postage paid.

Grow LILLY'S BEST SEEDS AND GROW RICH

Plant Lilly's Best Northern-Grown Seeds, grown on this coast for this coast, and be sure of profit. You will find that the saying, "Best for the West" is true in every case, and that Lilly's Best Seeds will give you best results. The above are only ten varieties of Lilly's Best vegetable seeds. For information as to the full line, write for

LILLY'S 1907 SEED CATALOG,

Which will be sent free, postpaid, on request. Lilly's 1907 catalog surpasses all previous books in attractiveness and completeness of plant information. It is thoroughly dependable, and besides containing descriptions, price lists and culture directions of thousands of varieties of seeds, bulbs, roots and cuttings, it is a handbook of information on poultry foods, poultry supplies, stock foods, fertilizers, garden supplies, sprays, horticultural supplies, etc. If you want one, free, mark an X in the white square.

HOW TO ORDER.

Mark an X in each white square opposite the variety of seed you wish to order, mark the quantity in square or on margin, figure up the total, clip out the ad., and remit in same envelope with the clipped ad. Be sure and write your name and address plainly, filling in the following blank:

Clip ad. and mail to

The Ornamental Garden

By ERNEST BRAUNTON

Eucalyptus Timber

WE are in receipt of the following letter from one of the largest vehicle manufactories in the United States, and, if any of our readers know where the desired timber may be obtained we should be very pleased to communicate the information to the firm in question.

"We are interested in the commercial value of eucalyptus wood and feel sure that you could help us insecuring the wood which we wish to test.

"These tests are to compare the value of eucalyptus with hickory in the manufacture of vehicle parts, and will open up a new market for eucalyptus here in the East if the outcome of these tests are favorable to the eucalyptus.

"We wish to test the following stock: 25 pieces of 1½x1½x28 inches and 10 pieces of 1½x1½ by 7 feet, from the following 20 trees; 4 trees each of:—Blue Gum (E. globulus,) Sugar Gum (E. corynocalyx,) Karri (E. diversicolor,) South Aust. Blue Gum (E. leucoxylon,) and Narrow-Leaved Iron Bark (E. crebra.)

"If possible we would like these trees to be of four different ages, the four ages being uniform for the five species. This would divide the stock into four parts as regards age. For instance, the cut from 4-year-old trees would consist of, 25—1½x1½x28 inches and 10—1½x1½ in. by 7 feet pieces of the five kinds of eucalyptus, making five 4-year-old trees.

"Each stick of the stock should be marked and the whole accompanied by a report showing the kind, size, and age of the tree from which the stock was cut. There should also be a statement of how much seasoning the stock had had before being shipped to us.

"We would be pleased to have you quote us the price on the above stock, bearing in mind that the stock is of no value to us unless the marking and history is guaranteed by the shipper.

"If you are not in a position to furnish the stock, kindly refer us to some party that you would recommend."

ROOTING CACTUS.

As there seems to be a great difference of opinion in regard to the proper soil in which to propagate and grow cacti and other succulents of like nature, a few words from a California cactus nurseryman might be of some assistance to some amateurs who are "halting between two (or more) opinions." I have experimented with all classes of cacti, in every different soil advocated by cactus growers in general, and find that pure white sand, neither too coarse nor to fine, is the best for all propagation and rooting.

It should be made damp, not wet, before planting your cuttings, and kept dry most of the time, not watering more than once a week at most, until cuttings are rooted. Some of the few exceptions to this rule are noted below.

Good drainage in all cases is essential to success.

Of all cacti, I have found pilocereus cuttings the hardest to root. I allow them to lie for two or three days with their butts to the sun in order to heal them, then dip into powdered charcoal, and plant in perfectly dry sand, and do not water until roots have started. When watering, a very weak solution of lime water will benefit Pilocereus, but does not benefit the majority of the other genera.

Most Echinocereus will stand but little water until well rooted. By following this treatment, I have found it easier in many cases to root cuttings, than to start new roots on plants. In rooting plants of these varieties, the same rules should be followed, after cutting off all old roots. Some varieties, as Echinocacti horizonthalonius, uncinatus and crispatus, with a few others, will strike latteral roots from the old ones, even after being out of the ground for three or four months, but it is best to cut off all roots from these as well as the others.

Flat-leaved opuntias as a rule will root very readily in almost any kind of soil, and in any degree of moisture. No rules can be laid down for any particular branch of the cactus family, as the genera approach each other so closely in some instances as to baffle, for a time, the best botanist. Each plant may need treating slightly different than any of the rest, and the closest study of each individual is necessary to success.

I do all my propagnating and rooting in lath houses, where they get partial sun all day.(E. B. 1894.)

BUY HOME-GROWN TREES.

A change in the surroundings of a tree always modifies its habit of growth. If the change is toward more favorable surroundings the result is seen in increased vigor, rate of growth, and size; if toward unfavorable surroundings, the reverse will be true. The stately Tulip-tree of the central Eastern States is said to be a mere shrub in Florida. The reason is that there it is out of its range of adaptation.

The White Elm, which grows with tall and vase-like form in New England, in the semiarid parts of Kansas and Oklahoma is low and spreading like an apple tree. Nor is form the only variable character. On the western elm the leaves are fewer in number, smaller, thicker, and much rougher than on the New England tree. In other parts of the tree there are differences of the same kind, though they are not so noticeable as those in the form and foliage. These variations have resulted from the differences in soil and climatic conditions to which the tree has been subjected.

The difference in form between two trees of the same kind in different localities has come through gradual divergence of characteristics. To a certain degree changes of this kind can be brought about in practice. When a gradual change is made in the surroundings of a tree a corresponding change takes place in the tree itself. Thus if stock of the New England elm be slowly moved westward through many generations, it will gradually change in form and other characteristics to be like the western tree; and it must be assumed that this change is necessary to enable it to live under its new conditions.

Sudden changes in the surroundings of a tree frequently cause its death, because it can not quickly change itself to meet the requirements of its new conditions. The New England elm moved at once to the semiarid West is likely to die, because it is not adapted to the conditions of soil, light, heat, and moisture of that region. In the prairie marshes of northern Indiana there are occasional knolls which once suported thrifty oaks of moisture-loving kinds. Now that the marshes have been drained the drying out of the soil has caused the oaks to die. The change was too sudden.

Suddenness and intensity of change often account for the failure of trees to thrive when moved away from the region to which they were adapted. This is also why Eastern trees so often die when moved to the West. This is why nursery stock grown near by can be more safely planted than that grown in a distant region. It is a practical matter, and should be generally understood, for it is of more importance to Californians than is the case in other States for our climatic and soil conditions are not duplicated elsewhere in the United States.

CONTROLLING JOHNSON GRASS.

Secretary Wilson in his annual report has the following to say about controlling Johnson grass:

It is believed that data have been secured which will enable the farmer to control Johnson grass and utilize it in a satisfactory way in crop rotation in the South. The secret of success in this work lies in the fact that in a Johnson grass sod left undisturbed for two or three years the rootstocks are found only at the surface. In this condition the pest is easily destroyed by shallow plowing and a little extra cultivation the next summer. This permits Johnson grass to be grown in a rotation, such as cotton, corn and cowpeas, winter oats and Johnson grass two years. Where the pest is allowed to grow on land that is cultivated in cotton or corn the rootstocks penetrate into the soil and eradication is extremely difficult.

Orange County Nursery & Land Co.

Successor to Orange County Nurseries

We have a large stock of Fruit and Nut Trees, Ornamental Plants, Roses, etc.

10,000 Valencia Late and Washington Navel Orange Trees.

Postal card gets you a price list.

We also have choice property, both improved and unimproved, for sale—Orange Orchards, Walnut Orchards, and Town Property. Tell us your wants.

QUERIES AND REPLIES:—Grape Questions; The Dual Cow; Pasture Weed; Bean Planting; Caked Udder; Breechy Cow; Grape Planting and Sour Sap; Dahlias and Olives; Kaffir Corn for Feed, 19.

HOUSEHOLD DEPARTMENT.—Counsel To A Friend, (From Shakespeare;) A Man and His Club, 20. Recipes—Nut Crack Night Bonbons; Pumpkin Chips; Roasted Goose, 21.

CALIFORNIA HORTICULTURALLY.—To Importers of Trees; Enlightened Supervisors; A promising Season; Beneficial Insects; A Boom in Dried Fruits, 22. Wealth in Irrigation; Hawks and Owls, 23.

PRACTICAL SOLUTION.

They are solving the labor question in Texas with the Japanese in a sensible manner. During the month of November, 300 Japs entered Mexico as laborers in the mines, but they deserted and came into the United States in a body. Now Texas has assured them, if they will remain as laborers, of kind treatment and all the emoluments which our treaties with other nations provide. We may learn wisdom yet from Texas.

STATE FARMERS' INSTITUTES.

The University of California hold a session of Horticulture and Entomology at Los Angeles, January, 7-12.

In a bulletin of instructions the University authorities announce:

"These courses are designed to meet the needs of all persons who desire to make themselves more familiar with the principles underlying farming operations and with the most approved practice. We will endeavor to make them in every way thoroughly practical.

"The short course is open to all persons of good moral character who have had sufficient school training to enable them to intelligently understand lectures, take notes, and perform the necessary text-book work. The better the previous education of the student the greater will be the benefit to be derived from the instruction given."

The Cultivator would urge as large an attendance of students at these sessions as is possible to obtain. Farmers will do well to "lay off" and "take in" the lectures in these courses. Graduates from High Schools should be interested in the University short courses when they can obtain them so cheaply and conveniently.

PULLMAN CAR TAXATION.

In the report of the Commission on Revenue and Taxation of the State of California, the advance sheets of which have occupied the attention of the Cultivator, for the past two weeks, reference is made to the glaring injustice in the present method of taxing this Company. The only taxes levied are on those cars it operates in the State during the year, and these are only such as are found in the State on the first Monday in March. All other cars operated during the year escape taxation.

In 1905 the total assessed valuation of car companies of all sorts was $981,485, and the taxes paid amount to $18,831.17. Of this amount the Pullman Company paid $10,522.85.

Taking a close estimate of the gross earnings of the Pullman Company in California in 1905, it will be seen that on the average 62 Standard cars, 400 miles per day, 365 days, at 7 cents per mile, earn per annum $633,640. Thirty tourist cars, 300 miles per day, 365 days, at 5 cents per mile earn per annum $208,050.00 a total earning during the year of $481,690.00

These figures fall far below the earnings of 1906, computed by the same method, which were in the immediate neighborhood of $1,012,875.00. Now, when we take into account the earning capacity of this Company whose total net revenue in 1905 is put at $27,122,020, with dividends declared $5,919,984, we are amazed that its tax total is but $10,528.85 in a State like California.

It should have been, at 4 per cent. of the gross earnings, at least $40,000 per annum. Instead, it is less than three-fourths of that sum.

Why such absurd and almost criminal variance has been permitted to exist so long, is something the average tax payer cannot comprehend.

It does not seem to one who has studied the question of tax revision in California, that it should occupy the attention of our legislators for any considerable time, to work out a law which is more just and equitable than the present one.

Certain it is that the Pullman Car Company is away below what it ought to be in the tax ratio. It should be raised in proportion to other values; for it has so far escaped with a mere bagatelle of what it ought to have paid in taxes annually to the State.

TAX REVISION.

The showing made by Gov. Pardee in his address before the Hanford Fruit Grower's Convention on taxation revision, is worthy of the most thoughtful consideration of every citizen of California. He shows by comparison of figures that the manufacturers pay half of 1 per cent. on their capital in taxes; while the farmer pays 1.14 per cent; two and a third times as much. Taken another form he demonstrates that manufacturers pay one third of 1 per cent. of their gross income in taxes, while the former pays 7 per cent., or 20 times as much.

If the same investigation be pursued relative to corporations, banks and railroads, it will be seen that the former pay .65 per cent. on their capital and the latter .30 per cent., while the farmer pays 10 per cent. on his invested capital.

It is so all along the line. Land, whether in the form of town lots, or in broad acres, bears a disportionate tax ratio to other property, and it is this inequality which the tax commission is seeking to correct. When we remember that the farmer pays a tax of 10 per cent. on his farm, while the manufacturer pays but 2 per cent., we do not wonder that our agricultural industries are lagging and our resources remain undeveloped. Persons engaged in agriculture with an average income of $500 pay $50 per capita per annum in taxes, while the manufacturers with an annual income of $870 pay $17.50 per capita per annum. The same inequality runs through personal property while monies and credits escape taxation almost entirely.

The same inequality exists on railroads, street railroads; express companies; light, heat, telephone and telegraph companies. These unjust conditions are telling on our agricultural growth, which is the basis of our State development. The remedy for this state of things lies in the adoption of the proposed commission bill, or some other bill, which does away with favoritism and puts all property of whatever kind or character on a fair and impartial basis.

CROSS-EYED VISION.

In writing of his observations enroute from Topeka, Kans., to Long Beach, Cal., Horace B. Cowgill, son of the editor of the Kansas Farmer says.

"The desert vegetation was interesting as far it went. Kansas was the most fertile of all the country on the trip till we reached the irrigated fields of California, and except for irrigation, Southern California would be the worst desert of all, I think."

Young Mr. Cowgill must have seen little of California, for with the vision he got of the State, in the narrow section he passed through, he could get no definite idea of the magnitude of California's possibilities. Coming over the Santa Fe, Kansas is the only agricultural state through which the traveler passes, but one acre of California land, well tended and properly irrigated, will produce more wealth than 100 acres of Kansas domain—and Kansas is a marvelously rich commonwealth.

ARE WOMEN TO ECLIPSE MEN?

Scientists are saying the time is near at hand when women are to supersede men in almost all the business affairs of life. They assert that by actual investigation it is is shown that women are growing stronger in body, much more rapidly than men, that their brain is developing along lines heretofore quite dormant; that they are taking up masculine work with an adeptness and success, which foreshadows their ultimate triumph in the field of competition with their now stronger fellows.

Recent attention has been directed to several achievements of women in agricultural life where amid the most strenuous endeavors, they have won out, while under practically the same conditions men have failed. Two women in Dakota, three stockwomen in Colorado, half a dozen in Nebraska are cited to show that by taking the place of men and doing mens' work they have achieved splendid success, become wealthy and absolutely physically superior to their male neighbors.

The solution to the problem is given in the fact that the moral character of woman is higher than that of man. She does not dissipate as does the man while her energies are all directed to the success of the enterprise she has in hand. The tendency of nature is toward strength always, but where it is thwarted by the evil propensities of mind and body it loses, rather than gains. The tendency in the male sex is toward a lower strata. The youth whose mental and physical strength is dwarfed from the use of the debilitating and debasing cigarette stands no possible chance in competition with the clean, bright healthy girl whose mind and body is free from such vile influences. If there is one habit more pernicious than another, to which the youth of the present day is addicted, it is the use of the cigarette. It is destroying more youth than whiskey is men.

It is no wonder women are out-stripping men in the race of life. Why should they not? They are purer in mind and body and following the irrevocable law of nature, must become mentally and physically stronger. For centuries woman has been the superior of man in morality, in charity, in loyalty of friendship, in usefulness. And now science comes to prove her growing physical and mental superiority.

News of Country Life in the Golden West

Southern California

HORTICULTURE.

The Placentia Orange Growers' Association is packing a carload of oranges to ship to London.

The Benchley Fruit Company of Fullerton will ship three carloads of oranges and a large quantity of tomatoes East this week.

Ripe figs were on sale at Indio, Sunday. Where is there another place in California that figs are being gathered and marketed at this season of the year.

W. B. Thompson of Chino, will plant his young walnut orchard—between the rows—to onions. As the orchard is a 160 acre one this onion field will be large.

The Yuma County Fruit & Cantaloupe Growers Association has been organized with 21 members at Yuma. Cantaloupes will be planted next February to the extent of 300 acres.

Allan Knapp, on his ranch at Katella, has just shipped a carload of lima beans East, the net returns from which were $2100. He operate one of the most productive ranches in Orange county.

The Benchley Fruit Company shipper five carloads of oranges that past week to the eastern market. One car, besides being loaded with the regular boxes, carried 10 baskets on top of the boxes.

Twenty-two carloads of oranges were shipped from Orange depot of the Santa Fe during the week ending last evening. The shipment of green peas average 75 sacks daily and of tomatoes 50 crates daily.

The new crop of lemons around Escondido is coming on rapidly and several teams are hauling immense loads to the packing-houses. The price is good, considering this is the season of lowest consumption.

The Corona Packing Company has pickers out this week on the property of the Boston and South Riverside Company's lands. They comprise about two hundred and fifty acres, and the fruit will be shipped out soon.

The Covina Orange Growers Association started packing on Thursday, Dec. 20., and will continue throughout the season. They will move five cars this week. The Covina High Land Citrus Union started picking on the 19th, and are now packing.

Fallbrook has produced some fine olives this year. A good many have been shipped, mostly to Gifford in San Diego, the price realized being about $60 per ton. They will be made into pickles. The smaller ones will be shipped later for oil and will bring about $40 a ton.

The Orange county walnut crop is practically all marketed, and from the best figures obtainable the product will reach between 4,500,000 and 5,000,000 pounds. Full half a million dollars has been put out to ranchers as a result of the crop harvest. This year the county went below its last year's mark.

The orange situation in the Redlands district has remained about the same for the early part of the season, so far as prices are concerned. The sales f. o. b. have been all about at the prices fixed by the shippers at the meeting held for the opening shipments, extra fancy being held at $2.25, with occasional sales for a better figure, and extra choice selling for $2.

California citrus fruit growers and shippers are being lined up with a view to making an organized effort to prevent the passage of a measure now before Congress known as the Sparkman bill. This bill, which was introduced by Representative Sparkman of Florida at the last session, seeks to regulate the size and style of orange box used by shippers all over the country. It is claimed in the interest of the shippers that last year the price of boxes was raised from 12½ to 21 cents, and this bill, if enacted into law, would compel them to use a certain make of box, thus allowing a further increase in price.

AGRICULTURE.

The shipment of celery from Smeltzer for the week ending December 22, was 114 cars. During the season 720 cars have been shipped. Owing to the car famine, the Celery Association has had to cancel many orders.

The loading of cars with celery still continues at Poloreno station, near old Newport. Twenty cars have been loaded so far, and the manager of the new packing-house, Mr. Sherrod, says that he exepcts to fill at least 150 cars.

The rain record for three days at San Jacinto last week was phenomenal, the fall having amounted to 3.24 inches—a figure never reached before within the same period of time. Ranchers who have not already their seeding done, are setting about plowing with a certainty of a big harvest. Pioneers say this and last season will prove to be like the wet seasons twelve years ago.

Mr. Charles Heil, who has lately been spending a good deal of time at his ranch in the Orange County peatlands, says that there have been about 700 cars of celery already shipped this season. While this is the normal amount usually sent off at this time of year, there could just as well have been 1000 car loads shipped by now as 700, had there been adequate means of transportation.

The planting of new citrus orchards promises to meet with a severe setback unless nursery stocks from Florida will be permitted to enter the State freely. The immense orchard projects in Tulare county are partly responsible for the serious shortage, and unless some source of supply is speedily located, the new orchards projected for Southern California must be put off for some time to come.

Redlands orange shipments have been heavier the past week than before, the total being eighty-nine cars of 362 boxes each, which is a greater number than last year by about two cars. The total for the season to date amounts to 211 cars, while the total to this date last year shipped from Redlands amounted to three times that number. The shortage of cars is in a great measure responsible for the few cars shipped. There seems to be little show for improvement in the line of extra cars, as the shortage is felt more and more all over the orange section as the season progresses.

Northern California

HORTICULTURE.

Christine is one of the best apple sections of the State and the crop was exceptionally good this year.

Two carloads of apple were shipped from Watsonville last night, bringing the total shipments for the season to date up to 1778 carloads.

An event of special interest to the vineyardists of San Joaquin county will be an institute to be conducted at Lodi Saturday, January 26th, by Professor F. T. Bioletti of the State University.

Cars of dried fruits have been shipped from Red Bluff every week from the opening of the season and Saturday three carloads were sent out to Eastern jobbers. Most of the output is already sold and the balance now on hand will be shipped soon after the first of the new year.

The peach output this year from Tehama has been about equal to that of last season, but apricots, always a variable crop, were quite light. Next year there should be an appreciable increase to this staple product. The fruit is packed exclusively in 25 and 50-pound boxes, nearly all with fancy paper tops or lace facings.

During the past six days up to yesterday morning, eighty-seven cars of oranges were shipped to market from the Lindsay district, making a total for the year up to date, 679 cars, an increase over 1905 of seventy-four cars. It is estimated that there will be about sixty cars more shipped from this point before the first of the year and several cars in January.

Geo. W. Sill of Watsonville has finished shipping apples for the season and has made a splendid record in view of the fact that this was considered an "off season." He forwarded 205 carloads of apples and the bulk of this stock was consigned to European points. The apples sent across the Atlantic met with high favor among buyers.

Ten cars of dried and canned fruits have been shipped from Winters last week, the Winters Canning and Winters Dried Fruit Company shipping the most of it. The Ernst Luehning Company is shipping figs and the J. K. Armsby Company is packing and shipping peaches and prunes. Shipments are going forward rapidly now, although it will probably be the first of February before everything is cleaned up.

AGRICULTURE.

During the last storm the rainfall in Suisun was 3 4-10 inches, making the precipitation for the season 5.61 inches.

The work of digging beets and delivering them to the Salinas sugar factory has been resumed. Over 40,000 tons of beets yet remain in the fields, and growers will be a very busy set of men until all are dug and delivered.

A number of farmers in Pajaro valley have not as yet sold their potatoes this season and most of them are holding out for still higher prices. This week there have been several buyers there but they have not been able to do much business owing to the fact that they and the man who has spuds can not agree on prices.

One buyer informed us that undoubtedly the choicest stock of potatoes in the State were those on hand in the Pajaro valley at present, and that they were far superior to the Oregon article that was being shipped into California at present. The buyers are offering as high as $1.65 per hundred.

The watermelon acreage in the Dinuba section promises to be larger than ever this year and every grower will do his utmost to get the first melons on the market, 640 acres in one piece has been rented and several smaller ones are being put in condition for melon growing. None of this land has been used for this purpose before.

The present favorable condition of the weather is very pleasing to the farmers in the Salinas valley and within a few days plowing will commence unless another heavy rain should come. From every indication the coming season will be one of the most prosperous ever known in the annals of Monterey and surrounding counties.

LIVE STOCK.

Pleyto has had about five and a half inches of rain, the country looks good and green, and stockmen are jubilant.

The farmers of Quincy and vicinity are very busy now putting in their crops and will be for some time, and stockmen are rejoicing over the good feed for their stock, the stock can get all the green feed they want and are doing fine. It is very likely they will have some early beef.

There has been sold and shipped from Anderson about $400,000 worth of cattle and hogs and farm products, exclusive of cereals, the consumption of these being greater than the production. The horticultural and agricultural industries are closely balanced in their productiveness, and combined total the tidy sum of $800,000.

It is said upon authority that a movement is on foot to reclaim nearly 30,000 acres of swamp and overflow land lying to the north of Sacramento, between the east bank of the river and the old Haggin ranch, stretching from the junction of the Sacramento and American rivers to the northern boundary of the county. This would materially add to the stock raising capacity of the county, if none should be tilled.

Reports from the Upper Tule district says they are having fine December weather with very little frost. The rain for the last week has been an inch, and feed is growing very fast for this time of year. Stock look well and cattlemen are jubilant over the prospects. The ground is well soaked, in fact ye correspondent has been here twenty years and never saw the amount of rain that we have had so far, start the water running in the gulches as it is now.

At a meeting of the Porterville Citrus Fair executive committee. J. H. Williams, A. G. Schulz and V. D. Knupp were appointed a committee to meet with committees from Lindsay and Exeter, to decide at which town to hold the second annual Tulare County Citrus Fair.

Moneta Farmers Institute

Editor Cultivator.—It might be of interest to the readers of the Cultivator to know that an unusually interesting farmers institute was recently held in Moneta, conducted by Mr. J. B. Neff.

While the attendance was not as large as it should have been, the interest manifested on the part of those who did attend was worthy of note, and indicates that at least a few people in this favored section are bent on doing the best thing possible to make their little ranches pay; this interest was due to a large extent to the Gardena & Moneta Farmers Club, a wide-awake, up-to-date club that meets once a month all through the year.

In this connection it may not be out of place to say that two of the papers read before the institute were read by members of the club, who, but for that fact would not have been heard from.

One of the papers treated of the practical side of berry-culture, giving in detail the cost of production of both bush and strawberries and giving in figures, the net profit obtained during the past year, and the comparative value of the different kinds of berries.

This paper was read by Mr. O. S. Gorham of Gardena, a practical berry man and was of unusual interest to those who are thinking of embarking in the business of berry-raising for market.

The other local paper was read by Prof. R. J. Rogers, principal of the Moneta scools. Mr. Rogers took for his topic, "The necessity of teaching Agriculture in the Public Schools."

The professor certainly did credit both to himself and the subject, inboth to himself and the subject indeed an address so valuable should be given greater publicity.

It goes without saying that Mr. Ward of Compton on apples, Dr. Twombly on Commercial fertilizers and the relative value of foods etc., and Mr. Ernest Braunton on landscape gardening were of paramount value to the people. Mr. Braunton could scarcely get away from the people. (his was the last paper on the program) so intensely interested were they.

The writer is a believer in the doctrine that credit should be given where credit is due, certainly much credit is due Mr. Neff for the earnest and able manner in which he conducted the institute, he has the happy faculty of bringing out the best thoughts of those who are in attendance and of maintaining an unflagging interest in the business of the institute from the opening to the closing. Surely people living in the territory assigned to Mr. Neff are to be congratulated on having so genial and thoroughly capable a man as institute director.

Yours truly,
C. W. STEPHENSON.

Gardena, Dec, 26, 1906.—

BUYS THE WORLD'S FAMOUS EGG FOOD NO. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER

Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland:

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Profit in the Poultry Yard

By Mrs. A. Basley, Hollywood, Cal.

Orpingtons

A FEW WORDS ABOUT THE Orpingtons may interest our readers, as a great many will be exhibited at the coming shows this winter.

The Orpingtons are English fowls and the English are proud of them. A comparatively new comer in the poultry world, it has by sheer merit won its way not only to the first rank, but to the position of the premier popular breed of Great Britian.

The five varieties of Orpingtons were all originated by Mr. William Cook of Kent, England. There are now three popular varieties of Orpingtons in England, the Blacks, Buffs and Whites and two new and less known, the Jubilee and Spangled.

Orpingtons have been popular in England ever since 1886, when the blacks were brought out and the Buffs in 1894, when they were first exhibited. The Blacks were made by crosses of Black Langshan, Black Minorcas and Golden Hamburg. The Buffs of Buff Cochin, Silver Dorking and Golden Hamburg. The Hamburg has given them their great laying qualities, and having been planned for utility purposes alone, they meet all the requirements of the "dual purpose" fowl.

The Buffs have been admitted to the American Standard and the Blacks are asking for admission. In England the Whites are not as popular as the Buffs and Blacks, partly because the majority of the fanciers are men (business and workingmen) who live in town and have only backyards in town lots, and we all know how difficult it is to keep white fowls looking clean on bare earth runs, hence the colored fowls are more popular in England than the White.

It does one good to see a true fancier, one who enthuses over his fowls and I do not know when I have had a greater treat than the day I visited W. A. Stewart's yards in Los Angeles. He has first prize winners from the chief shows in England, the Crystal Palace, the Alexandra Palace (Dairy) the Royal Lancashire, the Lancaster and others. It goes without saying that with such birds he can capture any prize he wants here. His Buffs show an even shade of rich, golden buff throughout, with under color a lighter shade of buff to the skin, the very quills of the feathers are buff to the skin.

Fanciers in the glorious Golden West have sung the praises of that truly wonderful and justly popular fowl, the "Buff Orpington" until they are as well known here as in their own home, "The Tight Little Island Merrie England."

Now I would like to say a few words about the "Black Orpington" to my mind the most beautiful, the grandest, and the king of all the Orpington varieties. The black Orpington was originated by the late William Cook of Orpington, England. They were the first variety and were first exhibited in 1886. They were built out of crosses between the Black Langshan, Black Minorca and Golden Hamburg, which gives them their great size and wonderful laying qualities. It is strange that they have been so long overlooked here, for they certainly are a magnificient fowl, and both for utility and now a growing demand among fanciers and lovers of beautiful poultry (especially among the rich who want something superb and out of the common) for the majestic Blacks.

In the last two years there has been a radical change in the type of this grand bird. A famous cock in England which was sold for $750, has never been beaten up to two years ago, would not have now chance of winning under a competent judge. Up to that time the type was a round, cobby-shaped fowl, but today a much larger, massive, square built bird, set on short stout legs with a tremendeous deep body from back to keel is wanted. This change in shape is a great advance, as it gives a much larger amount of breast meat which is most desirable for a table fowl. Size is of the greatest importance in Black Orpingtons, cockerels should weigh 10 pounds and cocks 11 to 13 pounds. The back must be short and very broad, with a graceful concave sweep to the tail of medium height, with a profuse amount of graceful curving sickles. The eye must be dark as possible. The flesh pure white of very fine texture so much sought by modern epicures. The chicks are very hardy, easily raised, mature early and appeal strongly to the small fancier as they are bred true to type and color, and the per cent. of culls from good stock is the smallest of any breed.

The plumage is abundant; the neck saddle and hackle in the male being very profuse. The hens having a great abundance of rich, glossy greenish black plumage. Color is of supreme importance and goes far to show the quality of the breeding. Pure black with a rich bottle green sheen is absolutely essential. Any dull brown, dull black with no sheen, or any signs of purple should be avoided, as these are very serious faults and good specimens cannot be bred from fowls that have them.

As layers, and particularly winter layers, they have no superiors and very few equals.

I have no doubt that in the near future there will be a perfect craze for this beautiful and useful fowl. One could not look on a more beautiful sight than a flock of real-up-to-date Black Orpingtons, with their rich, glossy plumage flashing in California's glorious sunlight. To those who are on the look-out for making a big strike in the poultry business, I say "go in for some real, good up-to-date- Black Orpingtons and reap a rich reward."

(This article on Orpingtons has been prepared to furnish information about the bird of which so much is said of late.—Editor.)

PREPARING BIRDS FOR SHOW.

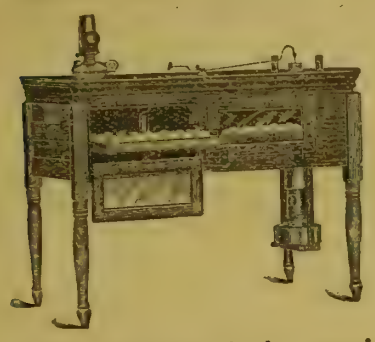
The individual who has given the minutest care to his exhibition stock from the time they were hatched until the present must be accredited with keen foresight. The training and special care of the birds must not be neglected until the time for the show is near at hand. It should begin when the chicks are hatched—and going still further back, we might say that it should have begun for the several preceding generations. We state this with the understanding that we are diligently trying to avoid saying anything that is in the least discouraging to you, reader; if you know that you have neglected this in a measure, do not let pass this season's opportunities; put your best efforts forth with the stock now available and determine to be in a better position another year.

The amateur will not find it the easiest task in the business to make proper selection of the stock which he must depend upon to win him honors. He should prepare himself by studying assiduously the requirements of the American Standard of Perfection, the authorized guide for judges in awarding premiums. All information that he can gain in one way and another he should turn to some value. It is plainly evident that birds for exhibition have to undergo considerable physical strain therefore all specimens should have vigor of constitution; they should all be in perfect health. If your birds belong to a class in which weight is one of the first considerations, take those birds of large size which promise to come up to the standard weight when properly conditioned. Do not select a small, undersized specimen and endeavor to bring it up to weight by putting on excessive fat; the results will in more than one respect be unsatisfactory. There is no detail which in selecting show specimens can be overlooked; defects sometimes almost indiscernible will throw a bird out of the competition. All these things must be watched against. If you do not consider yourself capable of passing judgment on the fowls, obtain the services of some one who knows them well.

Mrs. Potts: "They say that poets have to be born."

Potts: "That's what they say, but I never could understand why.

The "Chatham" Incubators and Brooders



are sold on their merits only—you be the judge

84 days free trial Take off 4 hatches to prove that the Chatham is the machine you want, then if not satisfactory it costs you nothing.

I want every reader to send for my free catalogue, telling all about this machine, and why "Women Succeed," "Profits in Poultry," "Broiler Raising," "Ducks for Market," "Which Hens to Keep," "About Turkeys," "To the Farmers," — a book of good useful information, and practical. Send a postal card with your name and address and this book will be mailed you free.

WHERE POULTRY COMES FROM.

It is not generally known that four-fifths of all the poultry of the United States comes not from the large poultry plant, but from the farm. Last year the United States marketed 20,000,000,000 eggs, and Secretary Wilson has recently added a department to the animal industry division with the idea in mind of swelling this another billion. The hen does not require a scientifically compounded ration, and all the food she consumes may be raised on the farm. As a general proposition, strict accounts are not kept with a flock of hens, otherwise they would be found to be as profitable, if not more so than any other industry found on the farm. The cause of pure-breds as against the scrubs scarcely needs treating, because more and more farmers are finding out that there is more profit in a well-bred fowl than in a scrub. More mistakes, however, are made in the feeding and care of poultry than in the kind kept. Hens need a variety of grain and they should be made to do a good deal of scratching for their living. In the winter they need green food, and nothing is better for them than clover hay, roots and cabbage. They also need animal food in some form if they are expected to lay well. A load of gravel will generally supply grit enough for the average flock in the winter, and fifty cents worth of time would prepare enough charcoal which may be burned from cobs. Overcrowding is a very common cause of loss in poultry, or at least it contributes to lessening the profits. Small flocks that are kept up to the highest state of productiveness should have about ten square feet of floor space per hen, and the Maine station found that twenty-five hens kept in a house built with room enough for them would lay more eggs than when fifty hens were put in this same house. As a general thing, too many farmers fall down in being poor salesman. If they will endeavor to find a market for their fresh egs in towns and cities they can always do it, and receive a premium at all times.

The hen house should be repaired before the storms of winter come on. If it has cracks cover them. Avoid roup by keeping the fowls well protected from the storms of winter.

If you want eggs in winter, see to it that your fowls are properly fed and watered, and that they are comfortably protected with scratching room, also with good dust bath, and on stormy days, do not allow them to go out. But give them comfort within. —Ex.

It is well known, though less well known than it should be, that chicks thrive wonderfully on plowed ground, and one well known poultryman plows up alternate strips of his chick range so that the young stock can have their choice of either fresh ground or grass ground. He insists that the youngsters spend most of their time on the plowed ground.—Ex.

A supply of pepper pods won't be a bad thing for winter. Boil them in wheat, oats, mash, etc., and feed now and then. Salted bacon is a treat to confined hens in winter—a little now and then, though expensive, will pay in egg results, and healthy fowl. Feed meats now and then. Salty bacon is said to be fine, tending to check the feather plucking.—Ex.

The Petaluma Incubator Company, of Petaluma, Calif., have just shipped two carloads of Petaluma Incubators and Brooders to Indianapolis, Indiana. This is the commencement of several such shipments that will leave here for the eastern field, as the trade is just opening up and the "Hoosiers," "Hawkeyes,", "Prarie Staters," Missourians," etc., will be liberal users of this Petaluma product before the season closes.

Chimmie—G'wan, you're no ball player. Yer couldn't ketch a foul if it was moultin'!

Patsy—Gittout, you couldn't ketch a fly if it was stuck on sticky fly paper till it was dead as merlasses!

"There's no doubt about it," said he, oracularly, "a man is known by the company he keeps."

"Nonsense?" replied the wise girl, "If the average man were really known by his company she'd shake him right away."

PREPARING SHOW BIRDS.

Preparing Coops.

Suitable coops should be in readiness for the stock selected, each bird being given a separate one. By all means do not crowd your birds into small coops. Have them of a reasonably large size—six to eight feet floor space and high enough that the fowls can not strike their heads and combs against the top. Have everything arranged as conveniently as possible. Place the coop in a poultry building, a well lighted, open-front scratching shed preferred, along the side of a wall. Arrange so that a light may be had in the house at night, as you will probably need to do some of the work in the evening. Into the coops put a quantity of straw, cut into short lengths perferably, excepting for feather legged birds, in which case the bottom of coop should be covered with sand. The coops should be cleaned twice a week and after the stock is washed, which is several days before the show, they should be cleaned daily.

To properly condition the birds they should be placed in these coops about two weeks before the show. This will give them plenty of time to become accustomed to their new surroundings and all the work necessary can be done in that time. When around your birds, make no undue noises that might frighten them. If they are naturally wild, they must be worked with to overcome this. When feeding them, approach as closely as possible and stroke them gently. You will gradually gain their confidence and they will become perfectly tame.

Training is quite important in preparing the birds. Typical carriage or symmetry is one of the chief requirements of fine birds, and training will induce them to assume a position which will show the specimens off to best advantage. It takes time and patience to train the fowls properly, but the results fully justify it. After some of the fear has gradually worn away from the bird, remove the coop and place on a stand. By gently stroking the bird under the throat it can readily be made to assume something near the desired carriage. There are many means by which the birds may be taught to stand correctly, and the ingenious fancier will make good use of those which may be suggested to him.

It takes an infinitely greater amount of work to properly fit white birds for the exhibition than it does the partially colored ones. In addition to all the other work, they will need to be given thorough washings to make them "as white as the driven snow." This is always an aggravating and patience-trying task, and right here frequently starts the fancier's discouragement.

Now Need Attention.

From the time the birds are washed until they are in the show room you should give them your closest attention. In every way try and prevent them from soiling their plumage. Do not feed a mash at this time—give them hard grains. When sending them to the exhibition be sure and start them so that they will arrive at their destination in time. Have the sides of the shipping coops inclosed and the top slatted. Watch your charges from the time they are started on their journey until they are safely home again. At our large exhibitions with so many fowls entered, there are very likely to be confusions, and it is best to take unusual precaution with their identification. On the shipping coop have a card bearing your name and address, the number of fowls sent in coop, leg number of each, etc. See that your entries are properly made.

The size of exhibit you make will be governed by the number of extra fine specimens you have the time you can give to their care, and the confidence you have in their quality. When conditions permit, it is the best to make a large exhibit, for several reasons. If you have a goodly number you will have a better opportunity of selling some of them, provided you wish to do so. It will make a better impression on those who may in the future be your customers.—R. H. Jones, in Commercial Poultry.

It is well known that he seldom lives frugally who lives by chance. Hope is always liberal, and they that trust her promises make little scruple of reveling today on the profits of tomorrow.

Germain Seed Company, Los Angeles, Agents for Southern California

WESTERN DISTRICT OF THE WHITE PLYMOUTH ROCK CLUB MEETING.

The growth of the White Plymouth Rock Club has been so great that the organization has been divided into five districts, each being represented by a governor.

The western district comprising Mexico, New Mexico, Colorado, Idaho, Utah, Washington, Oregon, Montana and California, will hold its first yearly meeting in Salt Lake City January 23, to 26, 1907. The meeting is not simply to boom the White Rock, but to promote interest in breeding fancy poultry, and the members are urged to send their birds and if possible attend themselves. D. T. Tolintick of Jacksonville, Ill., will judge.

The premium list of the Utah State Show does not mention the fact but I am advised by the secrtary, Mr. Sanders, that, in view of the fact that our district meeting is being held in connection with their show, that no entrance fee will be charged for White Rocks entered by members of the club. Let us give them a hearty response.

WILLIAM M. HUMPHREYS,
Governor western district.

THE SMALL FARM AS A TRAFFIC BUILDER.

If the railroads which received such magnificent gifts of public lands, a few decades ago, had possessed the light of the present day as to the superior traffic producing qualities of the small farm as compared with the big estate or "ranch," might not the history of railroad development have been different? Those lands were mostly sold in large blocks to speculators. These, holding them for a rise, forced immigration in thin streams farther and farther west, where the best lands were in turn tied up. The result was a sparse, widely distributed population. The railroads had to build long lines in pursuit of traffic, which, had the possibilities of the small farm system been known, could have been secured by shorter and less expensive ones.

Irrigation in the West was brought about a reversal of former processes in development. Before the day of irrigation it was almost invariably the case that the railroad preceded and attracted population. Now the population gathers, in the areas selected for irrigation projects, so rapidly that railroad managers have to 'step lively" in order to meet its demands and secure its traffic. From its inception, every irrigation project is the source of a great transportation business; which, so far from diminishing when construction work ends, goes on increasing.

The Burlington road recently sent out a large party of its officials on a tour of inspection of the areas in the "New Northwest" which are about to be irrigated with the purpose of making preparations in season for handling an immense traffic which they knew would follow. With the "creation" of this traffic the road had nothing to do. The Reclamation Service and the settlers do the creative work; the railroad simply profits by it. That is something different from the "development" which went on in the days of the land grants.

The first general convention of those vitally interested in the reclamation of the semi-arid regions of the United States by systems of scientific farming is hereby called to meet in the City of Denver, Colorado, on January 24th and 25th, 1907.

Tom Lewis' Fertilizer

The Best and Cheapest

For Orchard, Garden or Field it has no equal. A trial will convince you of its merits. Send for my circular of testimonials.

Tom Lewis brought to this office an orange weighing two (2) pounds, grown by W. J. Wilson, a prominent orange grower and vineyardist of Newcastle, Placer County, who has used Tom Lewis' Fertilizer for four seasons and swears by it.—FROM SACRAMENTO EVENING STAR, DECEMBER 23, 1904.

Office and Works, 1916 and 1918 10th St., Sacramento, Cal.

Little Wonder
Engine and Pump

The **Little Wonder** is still a favorite. Those who have used it constantly say "It's a winner." Also that it's true to name in that it is a "Little Wonder." It is a handy little pumping and general utility engine. It will run the pump, feed cutter, the grinder, the churn—any old thing on the ranch.

CITRUS GROWERS INSTITUTE AT RIVERSIDE.

Arrangements are being made for a gathering of citrus growers at Riverside during the latter part of January. Some of the questions which will be discussed will be;—"What Feature of Orchard Management, or after Management of Fruit, have produced the best results?"

The relation of the Citrus Experiment Station to the University of California."

"The practical value of Scientific Work in Commercial Results."

"What are the Specific Requirements for Producing the largest proportion of Fancy Fruit."

"What are the urgent Practical Problems to which the Citrus Experiment Station should give early attention."

Proposed Experiment Station work."

"What methods of Fertilizing Orchards have produced the best results."

"What definite progress has been made in fighting Insect Pests."

It is proposed to make this meeting one of the largest gatherings of citrus growers ever held in California and representative from all the citrus districts of the State are expected to be present.

The speakers will include Dr. Benjamin Ide Wheeler, Prof. E. J. Wickson, Prof. Ralph Smith, Mr. C. C. Chapman, Mr. R. C. Allen, Mr. C C. Teague, Mr. J. W. Jeffrey, Mr. S. A. Pease, and others prominent in citrus culture.

ORCHARD PLANTING.

With natural conditions favorable to the exploitation of rural economies and agricultural and horticultural wealth, it is no wonder that within a score of years California has become recognized as the center of fruit production in the United States, and one of the leading horticultural sections of the world, whose development is after all, only in its infancy.

Radical differences in soils and climates are often to be met with in the same orchard, and one locality is often blessed with as great a diversity as may be found in a whole State east of the Rocky Mountains. Hence local horticultural conditions are of prime importance when planting for profit is the consideration. Indeed, it is our experience that it is the very keystone to the successful prosecution of fruit culture as applied to California and the Pacific Coast.

Taking it for granted that the intending planter is reasonably familiar with the local conditions prevailing in his locality and on his land, a few suggestions on methods of planting will be found timely. Obviously, it is of the utmost importance that the land be put in first-class condition ready to receive the trees. This is accomplished by thorough plowing and cross plowing, followed by subsoiling and cultivation, until the soil is friable as an ash heap. Drainage should also be considered if the land is low and the trees are liable to "wet feet" during the wniter or rainy season. Be sure to have the future orchard symmetrical in order to economize the area to be planted. There are two methods or systems whereby this may be attained, viz.: the square and equilateral triangle.

After the field has been thoroughly tilled, and the ground plotted off to either of the preceding systems, and the trees have been provided, the next thing is to dig the holes, which should be deep and of ample size—the better the soil is worked and the roots of the tree spread out, the better the growth will be. In soils underlaid by a stratum of hard pan, it is essential to dig or blast through it. Trees cannot prosper in a soil so close and dense as to prevent root growth, which the breaking up of the layer of hard pan relieves.

A book is a living voice. It is a spirit walking on the face of the earth. It continues to be the living thought of a person separated from us by space and time. Men pass away; monuments crumble into dust—what remains and survives is human though.

The talkative listen to no one, for they are ever speaking. And the first evil that attends those who know not to be silent is, that they hear nothing.

I put MACBETH on my lamp-chimneys as I am satisfied to be known as the maker of the only good lamp-chimney.

There are other lamp-chimneys, but their makers fail to own them. It's no wonder.

My Index is useful to everyone who owns a lamp, and it's free.

Address, MACBETH, Pittsburgh.

Citrus Markets

The Eastern holiday trade in oranges has been unusually active and substantially everything offered has been taken, even though prices have ruled moderately high. Really good fruit, as is usual at this season, has been scarce. This has helped the market, but it is to be doubted whether shortage in anything really helps as much as liberal quantities at moderate prices, which insure free buying on the part of all classes of consumers. It isn't so many years ago that all oranges for the holidays came from abroad and their cost prohibited all but the more fortunate from having them for Christmas.

Florida helped to modify these conditions. The stock from that State was fairly satisfactory and as methods of cultivation and selection improved, there was a marked improvement in the fruit.

Next came oranges from the West Indies. These were rather indifferent in quality because they were picked from trees which had never been cultivated. And then came the development of the orange industry in California and sales have been liberal ever since.

At first it was impossible to obtain navel oranges in time for Christmas, but now large quantities are annually shipped here for the holidays. No one says or thinks that the fruit which comes at this time of year is as good as that which comes later, but the navel orange is such a favorite in New York that even when they are not up to the highest standard, they sell well. They have fairly good color and the decorative qualities are far more satisfactory than those of even the best Floridas. It is hoped that with the developments in orange culture which is going on throughout the producing belt in California, eventually fully ripened and well-colored fruit can be laid down in the eastern cities in December. It is not impossible and it is certain that Californians will accomplish all that can be done in this direction.

The Floridas which are displayed upon the stands are not of attractive appearance. They are spotted and otherwise disfigured. Of course this makes a difference in the sale. Many buyers will not take oranges which do not look well and it is certain that the Florida orange, on the average, is a poor-looking specimen of fruit this year. Perhaps some day a way will be found to develop the pale, spotted-skinned stock of Florida.

Not all Florida fruit is spotted, but the bulk of it is and those who do not feel as though they could afford to pay a fancy price are compelled to take the unsightly-looking stock. Then they sigh for the navels and say that all navels look well. It is pointed out that the difference between the growth of oranges in the brillant sunshine of California and the damp and cloudy atmosphere of the Florida sand dunes must be marked. Some time this fact will be even better appreciated, but now the effect is to make the Florida orange a slow seller in competition with the golden fruit from the Golden State.

NEW YORK MARKET.

December 31, 1906:—Navels are doing better and show from 10c to 30c advance. Lemons also show slight advance. Six carload of oranges and one carload of lemons sold today. It is raining.

LOS ANGELES, Dec. 31, 1906.—Friday, December 28, forty-eight carloads of oranges and eight carloads of lemons.

Saturday and Sunday, December 29, 30, forty-three carloads of oranges and fifteen carloads of lemons.

Total to date this season, 1646 cars of which 377 cars are lemons.

Total to same date last season, 3237 cars of which 544 were lemons.

Seedless Prunes.

One of the growing table dishes in the line of dried fruits is Seedless Prunes, prepared by the Selma Fruit Company. The saving in this article is seen in freight. It is nicely packed in pound cartoons and when eaten resembles very much seedless raisins in taste. The Selma Fruit Company is the only one that seeds prunes by machinery.

SACKS!

DO YOU NEED ANY?

You can always get them at L. Bernson & Co., the largest Bottle and Sack Dealers in California. 820-26 Stevenson Ave., Los Angeles Phones; Broadway 4611, Home 3439.

Queries and Replies

Grape Questions.

I wish to ask a few questions as I wish to put out a field of grapes and want late varieties. My land is mostly granite soil. Cañon sloping to the south. Some of it is clay subsoil, that is the height of it, and some of it is flat, somewhat bottom land. Which would suit Emperor grapes and which Golden Queen, Cornichon and Tokay. Elevation is 1900 feet. Is Golden Queen as hardy as Muscat? Muscats do well here, but not so large as bottom land produces them. Do you think the McPike grape would do well here on such land as I describe? I also have some damp and wet land, which slope would suit grapes the best, facing south or north? Some seasons we have late frosts in spring. Is it injurious to trim grapes late enough to make them bleed freely? Do you think winter Bartlett pears would do well in this altitude? The summer Bartlett don't always make a crop on my place, but are healthy otherwise. Apples do fairly well, but mildew some.—M. A. K.

Cornichon and Tokay do best on a heavy subsoil. Emperor does best on a heavy sandy loam in Southern California. It is a poor bearer on light sandy land while Golden Queen is an enormous bearer on such land. McPike bears well on a sandy land. McPike does this in the Sacramento Valley We would plant late grapes on the north slope as it would have a tendency to make them mature later and would also hold them back later in the spring and thus tend to skip the late frost.

Late pruning will not injure the vines if it is not put off so late that it will cause excessive bleeding. It will have a tendency to make the vines come out later.

Golden Queen is as vigorous as Muscat.—J. W. M.

The Dual Cow.

A correspondent writes to ask our opinion of the dual purpose cow for California.

The answer can only be made, we think ,as the editor of the Journal of Agriculture has stated it:

"If you want beef cattle, get beef breeds. If you are running a dairy for something besides glory, get the dairy breeds. It is one of the impossibilities for a cow to be two things—a real profitable dairy cow and a fist-class beef animal. The functions are too widely different; the characteristics are too much at war with each other."

There are advocates of the dual-purpose cow, to be sure—there are advocates of every sort of theory. But it appears to our mind that that particular theory is knocked out by the two questions of one of our leading scientific farmers: "Instead of keeping a dual-purpose cow to yield $40 worth of milk a year, why not keep the special-purpose dairy cow that will yield $80 worth? Instead of a dual-purpose cow that will raise a steer which at two years old will bring $40, why not keep the special-purpose dairy heifer which at two years will produce a calf, convert her food into milk and herself command as high a price upon the market as the steer of the same age?"

The dual cow is not so profitable in California as in the Eastern States, because we do not have the roughage to feed, nor do we have the summer pasture to range the cow on. The feed we give costs too much to attempt the raising of the dual purpose animal. We can succeed with any of the well-classified types of dairy cows, if we will, but the dual breeds are experimental and will remain so until we have arrived at knowledge of how to raise the roughage to best provide for the general purpose cow.

Pasture Weed.

Can you tell me what the enclosed plant is. It grows very thickly in my pasture. Is it Australian salt grass? Will the stock eat and will it run out pasture grasses?—J. G., Porterville.

The plant having neither flower or fruit we cannot determine with certainty what it is, but it is not a salt grass (atriplex.) Whether it will "run out" your pasture grasses or be eaten by the stock is for you to determine by observation, we have no better means for finding out than have you. If it is what it appears to be in the eyes of our botanist, it is a plant growing on low alkaline flats, conditions peculiarly suited to its successful growth, but not for grass.

Moving Palms.

A friend of mine gave me a fan palm which I want to move onto my place. The palm is as large as a wash tub near the ground. Please tell me the best time to move it, and tell me what I should do so I can get it to grow after I get it moved. If you don't think it will grow after moving, please tell me so in the Cultivator. Hoping to hear from you soon.—J. F., Del Rey.

This matter was very fully treated in The Cultivator some time ago—more fully than it will ever be again—such articles are worthy of preservation. Defer moving as long as possible. February is soon enough. Do not ball or box but take along as much earth as clings to roots. Set up and prop until earth is firmly settled. Give lots of water, preferably in the trunk, close to top and allow it to run down to basin below. Trunk needs water to furnish in lieu of supply stopped by cutting roots. Native fan palms are easy to move.

Bean Planting.

When may beans be safely planted to avoid the weevil?—J. D., Los Angeles.

We understand that July 10 is as early as planting is really safe. This would shut out planting in districts having a well-drained soil and no irrigation water. We also wrote to Mr. J. B. Neff of Anaheim as many beans are grown in his district. He replies:

"I have made some inquiries about time of planting beans as a means of preventing damage by weevil. The largest grower here says that he has never had any damage by weevil in beans that were planted as late as July, 10th and that he has escaped weevil sometimes on those planted two weeks earlier. He says he has beans on hand now that are two years old and that are as good as when gathered. This of course refers to the small white and Lady Washington. He says he never saw weevil in Limas. I was shown some weeviled small white beans that were said to have been planted about July, 4th, but the grower was not quite sure of the date."

Caked Udder.

I have a cow that has a caked udder. Tne bag is hard and sore.

Give the cow a full dose of physic (1 1-4 pounds of Epsom salts and an ounce of powdered ginger, steeped in a quart of warm water) drench. Follow this with 1 ounce of fluid extract of poke root, and two ounces of potassium acetate dissolved in a quart of water, twice daily, and rub the udder well after each milking with the following ointment: Take of Resublimbed iodine, 2 ounces; lanolin, 1 pound; mix well and apply.

Breeding Cow.

I have a Jersey cow that leaps any fence I can raise. Have tied a weight to her, but she goes over, weight and all. Can you suggest something to keep her within bounds?—R. D. C. —Woodlands.

An inverted ox bow set in a four-inch eucalyptus stick about two feet long with a pole extending out in front, just long enough to clear the cows nose, when she raises her head to jump the fence, will remedy the trouble.

Don't keep dehorned cows and cows with horns together in the same yard. Dehorn them all. It pays to look after these little things. Do it before bad weather sets in.

Grape Pruning and Sour Sap.

Please answer through The Cultivator two questions and oblige. (1) How is the proper way to prune malaga vines, one year old, and is it necessary they should be staked? (2) I notice so much sour sap at the forks and base of my peach trees; orchard is two years old; eight acres; trees are in fine shape and look healthy, but would like to know the real cause of the sap appearing?—J. G., Dinuba.

Prune your one-year-old Malaga vines with two branches with two buds to each branch. For the third year and from then on prune to one short spur with two buds and one spur with four buds.

Some fungus disease has evidently attacked your peach trees and no doubt you will get relief by spraying with Bordeaux mixture. You might write to Prof. R. E. Smith at Whittier. He has a peach disease man in your part of the State now.—J. W. M.

Dahlias and Olives.

Please tell me if dahlias do best in sun or shade, and what is the best olive for family use.—A Subscriber, Kingsburg.

Dahlias should have full sun as they grow too much to vegetation rather than bloom if in whole or partial shade. The best all around olive is a large type of mission. It makes good oil and is one of the best pickle olives.

Kaffir Corn For Feed.

I should like a little information. I plant Kaffir corn for green feed, commence to cut it as soon as it is large enough and of course the second growth springs up and is nice feed, or would be if I dare use it, but I have a neighbor who came from Kansas where they grow a great deal of Kaffir corn, but my neighbor tells me they never feed the second growth as it kills the stock. So I have not used it. Do not care to experiment as I have some very valuable Jersey cows. Do you know anything about it? Is the second growth considered poisonous to stock? Is it or is it not used as feed? An answer through the Cultivator will be thankfully received.

D. F. F.

There is often trouble from cornstalks when over-fed or when the corn is frosted and then mildewed. There is a regular disease from feeding the second growth that prevails in the East but I have never known of it in California. Here the trouble is simply bloating, to overcome this feed the cornstalks in the mangers. Sometimes when mildewed the cows scour badly, this however happens with any musty or sour feeds. The mares with colts are even now running in our corn fields and it makes the best of feed for them.—M. E. S.

"The trouble," said the dentist, as he probed away at the aching molar, "is evidently due to a dying nerve.'

"Well," groaned the victim, "it's up to you to treat the dying with a little more respect."

Household Department

Counsel to a Friend

Give thy thoughts no tongue,
Nor any unproportioned thought his act;
Be thou familiar, but by no means vulgar;
The friends thou hast, and their adoption tried,
Grabble them to thy soul with hooks of steel;
But do not dull thy palm with entertainment
Of each new-hatch'd, unfledged comrade. Beware
Of entrance to a quarrel; but, being in,
Bear 't that the opposer may beware of thee.
Give every man thine ear, but few thy voice.
Take each man's censure but reserve thy judgement.
Costly thy habit as thy purse can buy,
But not expressed in fancy; rich, not gaudy,
For the apparel oft proclaims the man.
Neather a borrower nor a lender be,
For loan oft loses both itself and friend,
And borrowing dulls the edge of husbandry.
This above all—to thine own self be true;
And it must follow, as the night the day,
Thou canst not then be false to any man.—Shakespeare.

A Man and His Club

"YOU WAIT," Eleanor said to me whenever I complained about Jerome's remaining at home evening and never going to the club. "In a year's time you will be begging him to graciously grant you an occasional evening of his society. I know men and their ways."

Privately, I pitied my sister Eleanor; she had had such an unfortunate matrimonial experience and was so soured by it.

"I don't think you know Jerome," I told her, patiently. " He is the kind of unambitious man to settle down at home in a perpetual attire of dressing gown and slippers and let all of his interesting men friends drop. I have coaxed him, night after night, to go over to the club, just to keep in touch with his old set, but he won't listen to me; says he is perfectly happy and does not want to see anyone else. I believe in a man's running into his club now and then, if only to make him appreciate home the more."

"Poor misguided child," said Eleanor, commiseratingly.

This conversation took place when Jerome and I had been married ten months, and just six weeks later my husband came home early to dinner. This unusual departure from his customary habits filled me with consternation, but although I felt that something lay berind his promptness, I was totally unprepared when he remarked: "I believe I will run over to the club this evening. Election is pretty close, and I want to see some of the fellows about a deal in our district."

"By all means," I assented, cheerfully. "I am so glad."

I did not sit up for my husband. Once upon a time I read something somewhere to the effect that nothing irritates a man so much as to return from a pleasant evening to find a wife waiting for details of just how he spent the hours away from her. Therefore, I went to bed and to sleep. Nevertheless. I was scarcely prepared to find Jerome still absent when I awakened shortly after midnight. However, I pretended to slumber when he finally came home about 2 o'clock, and refrained from any comment on the lateness of the hour.

The next evening we resumed the persual of a book in which we were both much interested, Jerome reading aloud while I sewed.

We were obliged to stop at a most thrilling point by the advent of some chance callers, and I could scarcely wait until the next night to continue our story, but, alas! just as we were finishing dinner Jerome cleared his throat curiously and said:

"I find I must go over to the club again this evening. Hart said he wanted to see me on a matter of the utmost importance."

To say that I was startled would be expressing it mildly, but as I have always prided myself upon being consistent I swallowed my disappointment and managed a very creditable smile.

"All right," I said as cheerfully as possible, and then as he rushed off, added: "Have a pleasant evening."

"It won't be very pleasant, arguing with a lot of men," he grunted.

Resolutely I went to bed at the usual hour, but in spite of the utmost endeavor, sleep would not come.

Eleven o'clock, twelve o'clock, one o'clock struck; two o'clock, half-past two and still no Jerome. It was inconceivable that he should linger so over a mere matter of politics or business. Could it be possible that something had happened to him? Some accident?

Stung into uneasiness by the horrid fear, I stole out of bed and to the window.

The street stretched before me an avenue of silence. I bit my lips with nervous terror as the moments passed and no one came. Then at last a step resounded through the stillness. It was Jerome, it must be he; but the man, a small, thin person who walked with a jump, passed quickly.

Another length of silence, then the sound of carriage wheels. My heart stood still. He was hurt, then, and they were bringing him home to me, maimed, perhaps unconscious.

The cab drew up in front of the house and Jerome sprang out alertly. He came up the steps like a man well satisfied with himself.

I shivered back to bed, speechless with fury, but again feigned slumber and said not a word to my miscreant spouse.

The next morning Jerome was crosser than usual at getting-up time.

"I am worn out," he remarked, with the air of a martyr.

"I should think you would be," I retorted, "considering the time you came home last night.'

"Yes, I thought I never should get away. How those men can go on living like that, sitting around and smoking and arguing all night long every night, as they do, is beyond me."

This was somewhat mollifying, but he continued: "The worst of it is I have promised to go over again tonight. Hart has a banquet or something on, and you know it is very necessary that I stand well with him."

I closed my teeth with a little click.

"How about our reading?" I demanded.

"Awfully sorry, little woman, but you had better finish that book yourself; there is no telling when I shall be able to go on with it."

"Then you mean to go out every evening hereafter?" I inquired, controlling my voice as well as I could.

"I expect to have to go pretty frequently for the next few weeks. Of course, any time you want me especially to go out with you, just let me know a little in advance and I will try to arrange it."

"And do you intend to always return at 3 a. m., and require the services of a cab to land you home in safety?"?

My husband flushed furiously. He hates criticism.

"You have been at me all along to go to the club," he said angrily. "Now that I am obliged to go you are making a row about it. If that is not just like a woman!"

I shrugged my shoulders.

"I wanted you to go to the club occasionally, but had no idea you would suddenly take it into your head to spend every night there."

"That is just about the way you usually exaggerate everything," sneered Jerome.

"And you need not expect me to believe that you do go to the club," I continued warmly; "you would never keep such hours with a lot of men.,,

"Oh, now you are getting silly," said my husband, and he flung off, slamming the door behind him without a single attempt to pacify me.

Of course this strengthened my suspicions.

Some one has said that there is always a woman behind everything, and I wondered, miserably, who the other woman might be in my Jerome's case.

When Eleanor called that evening, accompanied by her newest admirer,

she found me writhing upon the bed and deluged with tears.

I told her everything in short, broken sentences. It was a relief to unburden my mind, and I knew she would blame my husband quite as much as he deserved. Eleanor never made excuses for the men.

She stared at me when I finished my pitiful story, as one who might say, "I told you so," but her first words were: "You are surely not going to stay here and mope?"

"What else is there for me to do?"

"Put your things right on and come to the theater with Mr. Harvey and me. We called to get you both, but as Jerry is not here there is no reason on earth why you should not go out and have a good time instead of making yourself miserable alone. Then you must come home with me and spend the night," she continued.

"Oh, Eleanor!" I gasped, "I couldn't do that."

"Why not."

"Jerome would be worried to death."

"I do not see why he should not be the one to worry instead of you. Teach the young man a lesson, I say."

"But he would never forgive me."

"All the better, if he cares no more than that. I should think you would have more independence. Besides he will forgive you; men always do, and when he thinks you have run off and left him for good, he will be willing to grovel, if it will only bring you back."

The thought of Jerome's groveling was particularly pleasing to me, and I began to dab the tears from my eyes.

I might as well have been at a funeral instead of the theater that evening, for all the enjoyment I got out of the performance. Neither did I sleep a wink the whole long night.

At 5 a. m. I stole into Eleanor's room.

"I am going," I said, rousing my sister with much difficulty. She sat up and blinked at me.

"Well, for goodness' sake go and leave me alone!" she retorted, and dropped straight back to dreamland.

I hurried through the deserted streets, feeling the chill of early dawn in my heart.

Suppose Jerome should refuse to forgive me. He was fearful when aroused.

I stole into my own home like a thief, moving as quietly as possible, but before I was well over the threshold my husband confronted me. He looked very unlike himself, with clothing disarranged, disheveled hair and wild eyes.

"Lola!" he cried, and the next minute I was lying on his heart and there were really, truly tear-drops on my face, a strong man's tears.

"Oh darling!" I sobbed, "I am so sorry."

"Where have you been? What has happened?"

With genuine shame I confessed my petty jealousy and how I had tried to punish him.

Jerome looked very serious.

"Dearest, I have had to go to the club these evenings. I did not like it one bit better than you did, but you know you want me to get on in the world and amount to something."

I nodded an affirmative.

"Well, if Johnny Hart carries the district he can put me in the way of doubling our income. You do not understand these things, and I did not like to talk about it when there was nothing certain."

"Oh, sweetheart! can you ever forgive me?" I sobbed.

"There is nothing for me to forgive, since I must have hurt you cruelly to make you run away from me; but, beloved, we must try to understand one another better and have more confidence."

"I shall always believe in you after this," I announced, firmly, "no matter what happens." And I meant it, too, just at that moment.— HELENE HICKS.

IT'S PENNY WISE

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 2124 Willow St., Los Angeles.

Piles Cured In 6 To 14 Days.
PAZO OINTMENT is guaranteed to cure any case of Itching, Blind, Bleeding or Protruding Piles in 6 to 14 days or money refunded. 50 cents.

RECIPES.

Nut Crack Night Bonbons.

Boil together uutil it threads, one pound of brown sugar, half teacupful of milk and two squares of grated chocolate, add a pinch of cream of tartar and when done add a tablespoonful of butter and remove from the fire, beat in two tablespoonfuls of cream and flavor with vanilla, pour on a marble slab and when cool enough to handle work with the hands for thirty minutes. Form into fancy shapes, with the addition of almonds, English walnuts, dates and grated cocoanut. Scoop out a small pumpkin, line with oil paper and use as a bonbon tray.

Pumpkin Chips.

Pare, slice and scrape the inside of a round, yellow pumpkin, cut into pieces one inch square and thin as a knife blade. Put to it an equal weight of white sugar and let stand twenty-four hours, there will then be sufficient syrup to cook it. Boil gently until nearly done, then add one lemon sliced thin for each pound of pumpkin, cook till fruit is clear. Take up and boil the syrup till thick.

Roasted Goose.

Select a green goose—one four months old—pick well; singe and clean carefully. Roast for two hours, dredging and basting frequently. Cook the liver and gizzard in a stew pan and prepare the gravy with them as for a turkey. Stuff with boiled chestnuts and serve with apple sauce and currant jelly.

These may be cut in the shape of wands, from sponge cake, and spread with a mixture of conserved cherries and nuts moistened with orange juice.

A WONDERFUL HEATER

It Solves the Problem of Fall and Spring Heating and Supplements the Regular Heating Apparatus in Mid-Winter

With the passing of the summer months comes Autumn, and with it the chilly nights and mornings which force us to turn our thoughts to the problem of heating our houses, and we begin to look over our stoves and furnaces and get them in repair for the cold winter months.

To start stoves and furnaces in the early Autumn brings more or less discomfort for the reason that they furnish too great heat during those portions of the day when the heat of the sun is still considerable. For such times the Perfection Oil Heater, equipped with a device which prevents all possibility of smoking, solves this hitherto perplexing problem.

There are also many times during the cold winter months, while the furnace and stoves are in operation when they may not be equal to the task of warming remote rooms, hallways, etc. This is more apt to be true in the early morning before the full efficiency of the regular heating apparatus is developed. In many houses there are rooms not reached by direct heat. At such times and in such places the Perfection Oil Heater will be found a very valuable auxiliary. It will enable the household to eat its breakfast in comfort instead of shivering with the morning chill.

The Perfection Oil Heater produces a surprising amount of heat immediately after lighting and will heat an ordinary room in a remarkably short time. They are strong and well made in a design pleasing to the eye, and they are light enough to be easily carried from room to room as required.

In these days of numerous devices for illumination, there are still many who have not provided themselves with satisfactory lamps. The Rayo Lamp makes it posible for everyone to have adequate light at a small cost. The Rayo Lamp is the best lamp for all-round household use. It is made of brass and beautiful nickeled, and is an ornament to any room whether in palace or cottage.

The Perfection Oil Heater and the Rayo Lamp form a combination that makes home bright and comfortable. Their absolute safety and very moderate price make them a valuable and easy acquisition to any home. Both heater and lamp are warranted.

When writing advertisers mention Cultivator

Have You an Extra Room to Heat?

There need not be a cold room in the house if you own a PERFECTION Oil Heater. This is an oil heater that gives satisfaction wherever used. Produces intense heat without smoke or smell because it is equipped with smokeless device—no trouble, no danger. Easily carried around from room to room. You cannot turn the wick too high or too low. As easy and simple to care for as a lamp. The

PERFECTION Oil Heater

(Equipped with Smokeless Device.)

is an ornament to the home. It is made in two finishes—nickel and japan. Brass oil fount beautifully embossed. Holds 4 quarts of oil and burns 9 hours. Every heater warranted. Do not be satisfied with anything but a PERFECTION Oil Heater. If you cannot get Heater or information from your dealer write to nearest agency for descriptive circular.

The Rayo Lamp makes the home bright. Is the safest and best lamp for all-round household use. Gives a clear, steady light. Fitted with latest improved burner. Made of brass throughout and nickel plated. Every lamp warranted. Suitable for library, dining room or parlor. If not at your dealer's write to nearest agency. STANDARD OIL COMPANY.

WAGONS

There is always one by which the rest are judged. Ask any farmer which wagon he places the most confidence in; ask any expressman which wagon lasts the longest with fewest repairs. The answer will be,

The Studebaker

No one ever claimed to make a better wagon than THE STUDEBAKER. It couldn't be done. Many are said to be "just as good." If none is claimed to be better by the competitors, and the Studebaker is looked up to as the standard, isn't it pretty good evidence that it is the best?

Every wagon put out by the Studebaker factory is as near perfect as it is possible to make it. Everything from tongue to tail-board is of matchless superiority.

Don't waste money on an inferior wagon, but begin right and get a STUDEBAKER. These wagons, in various sizes, may be seen at the large salesrooms of the

Ten Reasons

WHY THE

Addison Pump

Is Better Than All Others

1. It will pump more water with less power.
2. It is more substantially constructed.
3. Has no overhanging bearings to spring and cause friction.
4. Absolutely uniform motion—does not break rods.
5. Plunger leathers can be changed with less trouble and expense.
6. Water discharge in continuous stream—no pulsation.
7. Noiseless in operation.
8. Has no jar or hammer.
9. Perfectly balanced, so no braces are required to keep pump in position.
10. Will be in good working order when pumps with erratic or variable motion are in the scrap pile.

The "ADDISON" pumps more water for the amount of power consumed and with less liability of breakdown than any other pump.

With the recent changes in the factory and management we are prepared to make quicker delivery, and a better pump for less money than ever before.

It will pay you to write us for catalogue and prices before purchasing a pump.

When in town call at the factory and see our pumps.

Petaluma Homes

$1,700 10 acres rich loam soil, 3-room house, barn, hen houses, wind mill and tank, growing crops, four acres in fruit. Price $1,700. Place located one-half mile from Cotati, which is located 8 miles from Petaluma on railroad close to station.

$1,500 6 acres fine for Fruit, Poultry or Vegetables, 3 miles from Petaluma. Has good 4-room house, barn, 5 hen houses, good well water. Price $1,500.

$1,600 8 acres, 4-room house, barn, 3 hen houses, place is all fenced with wire netting. Wind mill and tank. Price $1,600; terms, one-half cash, balance in 3 years, 6% interest.

Petaluma Realty Company
801 Main St. Petaluma, Cal.

POTATO FUNGUS.

Small brown bodies not easily removed by washing often seen on potato tubers are caused by a fungus, Rhizoctonia or Corticium. As a rule they do not seem to cause much damage. But in Ohio a disease called "rosette," causing stunted growth and premature death of the potato plant, is ascribed to this fungus, and in Colorado a trouble called "little potatoes," is found associated with this fungus, which there also attacks the main stem of the plant near the surface of the ground.

The formalin treatment given for scab has been recommended for this; also the planting of clean, well-formed tubers.

California Horticulturally

By JOHN ISAAC, Sacramento, California

To Importers of Trees

IMPORTATIONS of nursery stock from the Eastern States are already beginning to arrive, and during the present planting season, extending over the next three months, there will probably be the heaviest importation of deciduous trees from outside points ever known in the history of California. This is largely due to the good prices which have prevailed for fruit during the past three years, the increase in the number of orchards, the cutting up of large tracts and the facilities afforded for getting to the Eastern market. So great has been the demand for nursery stock, that it has been impossible for our local nurseries to meet it, and as a result there has been a heavy call upon outside nurseries. While every encouragement should be offered to the planting of orchard trees in California, it should still be borne in mind that the reckless importation of fruit trees from different parts of the world in past years has been the great cause of introducing into our orchards all the insect pests and fungus and bacterial diseases with which we are now afflicted and which entails an annual cost of millions of dollars to our fruit growers to keep in check.

There are three very serious peach diseases in the Eastern States, which are highly contagious and which Professor M. B. Waite states are worse among the peach trees than is the pear blight with the pears, although this seems almost impossible as the pear blight is the most fatal disease we have ever had to contend with. There are very extensive areas in the East where the peach industry has been absolutely destroyed and where it is impossible to grow peaches owing to these diseases, the chief of which is the Peach Yellows, the next being the Peach Rosette, and third, Little Peaches.

Every effort has been made on the part of our State Horticultural Commission to prevent the importation of any trees from sections in which these diseases are prevalent, and it is the duty of our county horticultural commissioners to see that the law relating to the importation of nursery stock, fruit or vegetables, brought into the State shall have plainly and legibly marked thereon in a conspicuous manner and place the name and address of the owner, shipper or person forwarding or shipping the same, and also the name, of the person, firm or corporation to whom the same is forwarded or shipped, and also the name of the country, State, or Territory where the contents were grown.

The horticultural commissioners should see to it that these requirements are complied with, or prevent the delivery of any outside stock which does not come up to the requirements of the law.

It may be well to state here the sections which are infested in order that our importers may be on their guard. The Peach yellows is found in New York, Massachusetts, Connecticut, Rhode Island, New Jersey, Delaware, Maryland, Pennsylvania, Virginia, Michigan, Indiana (northern section,' Illinois (southern portion,) Kentucky (eastern portion,) North Carolina, Arkansas and Tennessee (eastern portion.)

The Peach Rosette is known to exist in Missouri, Arkansas, South Carolina, Georgia and Kansas.

ENLIGHTENED SUPERVISORS

The supervisors of Santa Cruz county are to be congratulated as a body of broad-minded men, instanced by the liberal aid they have given to the chief industry of their county. The Pajaro valley has a world-wide reputation for its apples, but like all other sections of the State, it has suffered severely from various pests. For several years past, the supervisors have joined hands with the horticulturists of that county and made liberal appropriations to assist in the work of carrying on experiments for the control of these pests, and with such good results that the Pajaro valley apples are freer from worms and the trees are cleaner than those in any other part of the State. They have lately made an appropriation of $1000 to assist in the work of keeping an entomologist employed carrying on experiments, and they are broad-minded enough to realize that it is money well spent.

A PROMISING SEASON.

The present season has opened very auspiciously in Northern California. Heavy rains have fallen; the ground is in excellent condition; plows are running in all directions and farmers are rushing in their crops as rapidly as possible. The late rains, after thoroughly soaking the ground, have ceased, and given every opportunity for work. There have been no drying winds since, and all the moisture soaked into the soil. It is too early yet to predict what the season will be, but it has opened in excellent shape for the farmers in the northern part of the State and they are taking advantage of it.

BENEFICIAL INSECTS.

George Compere, who has been on an expedition in search of beneficial insects for the State Horticultural Commission returned home from his tour on the Nippon Maru on the 17th inst. He brings with him a large number of different beneficial insects, among which there are two internal parasites, which he has found working on the Red Scale and the Purple Scale. These he secured in China and has cared for himself on the voyage home and arrived with them in good condition. They have been established in the State insectary, where they will be cared for and watched with much interest as to the outcome. It is sincerely to be hoped that this sending will develop parasites for both these formidable scales which will be thoroughly effective, and if they do not entirely eradicate the pests, at least keep them so far in check that they will not be regarded as serious.

Of course it is yet too early to predict what the out-come of this sending will be, as there are many contingencies to be met and overcome before on introduced insect is thoroughly established, but it is Mr. Compere's belief that he has secured a most effective check upon these scales.

BOOM IN DRIED FRUITS.

Holders of dried fruit this season have certainly no cause to complain of the matter of price. Markets have been active in all lines, and prunes and raisins have jumped up to a figure unequalled in many years past. The prune growers, who have sold for years at a close margin are especially jubilant, as they are reaping a small reward for their labors in the advanced prices they are receiving this season. The same is true of raisins which have advanced to a figure unequalled in many years. This condition is largely due to the great shortage of the European crop; the raisin crop of Spain being almost a failure, and the active demand for our fruit in the

outside markets. All along the line, fruits have brought better figures during the past year than usual. Peaches, pears and apricots have brought remarkably good prices, but, as usual, when prices are high, crops have been somewhat below the normal. However, on the whole, fruit growers have no cause to complain of the past year.

WEALTH IN IRRIGATION.

There is probably no country in the civilized world where the value of water is more thoroughly esteemed than in California. This is true because the rainfall is not over plentiful, often short, which makes water difficult and expensive to get.

The wonderful changes wrought in the state in the last few years and the growth of values both real and personal are due to the introduction of comprehensive methods of irrigation and conservation of water. Intelligent observation has done much to determine the methods which, when practically applied, have brought into use thousands of acres of land heretofore without special value.

It is claimed that the great San Joaquin valley in Central California is equally rich in natural resources and has besides in the Sacramento river a limitless water supply to irrigate millions of acres.

Yet, because the San Joaquin has rainfall, no irrigation has been developed and the land is planted to vast fields of wheat, resulting in an entire lack of settlement of the valley, whereas the region around Los Angeles, having much less rainfall, has become thickly settled with a prosperous energetic class of people who are making it one of the most wonderful regions of the United States.

Los Angeles is simply an instance of where adverse conditions have actually forced development. This is often possible where the active factor of development is the pushing, aggressive American. Under the old Spanish regime, Southern California would be today where she was at the time of the Mexican conquest.

All this good coming out of supposed evil or misfortune can be seen in a still different phase in this same locality.

Giving up in despair the idea of getting enough water out of the mountains, the ranchers commenced boring and pumping tests to try and save their orchards.

The result has been a marvelous underground water development everlasting in supply and easily controlled. Twelve thousand acres of oranges at Riverside are irrigated from underground waters. Water was found in many places where it has been said there could be no water.

The orange orchards of California begin to bear if well cared for, at four years from transplanting. When they are 12 years old they may bear 300 boxes of oranges to the acre, which will likely net the grower $300, and if his orchard is well located and not subject to frost, he will probably hold it at $2,000 an acre. An enormous figure, yet warranted by the returns. But on the other hand many acres, through mismanagement and poor location, barely return expenses. The soil of California is rich and this fact, it seems, is not proving an unmixed blessing to the people.

They have not apparently given exhaustive study to the fertilizing question. Many of the old orchards are not producing as vigorously as the smaller trees where the soil has not been depleted. The growers do not seem to expect so much of an old tree.

As a matter of fact, age should be no bar to an increasing yield until the orange attains its full growth and the foliage interlocks in the rows.

In Florida the growers apparently understand feeding the trees better, and, again, for the same reason that has in general built up California. The Florida orange grower has no soil, so to speak. He plants his trees in almost pure sand, and so has had to make a close study of supplying them with food from the start.

In a crop so intensive and valuable as the orange or lemon, the question of the cost of fertilizer does not really enter. Half a ton to the acre is a large application in California. A ton to the acre is not unusual in Florida.

Irrigation begets good cultivation. The old way was to flood on the water, after it had sunk into the ground run the cultivator over lightly and then in a short time irrigate again. This left the roots at the surface and necessitated the use of much water. Now better results are obtained by three, four or five good soakings, followed by a deep and continual stirring of the soil.

Southern Chief DISC PLOWS

MOLINE PLOWS AND OTHER FLYING DUTCHMAN FARM TOOLS

Built with Special Reference to the Requirements :: of PACIFIC COAST Farmers and Orchardists ::

These plows are made entirely of steel, malleable and cast iron. They are well braced, strong and easily controlled. The three disc can be converted into a two disc, and the four disc is easily changed into a two or three disc. A farmer having a two disc can make a three disc by securing the extra parts.

LEVER RODS SLIDE THROUGH ADJUSTABLE CONNECTIONS

Keeping the Levers and Operator Always in the Same Relative Positions.

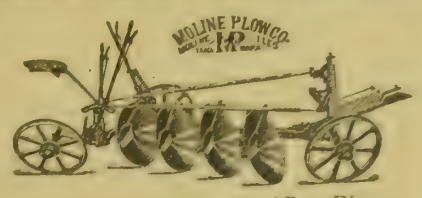
The location of seat, wheels and hitch are right, giving good penetrating power and permitting of turning to either right or left. The front wheel is under control at all times and the plow can be steered at will.

The Orchard Axle Attachment

with which either size of these plows can be equipped is a splendid thing for orchard plowing, and especially where it is desirable to work up under the branches close to the trees.

Permits of Closer Work than Can be Done with a Walking Plow

The plow with this attachment can be used for general work as well as for orchard plowing.



Made in Two, Three and Four Disc

SIMPLE WITHOUT SACRIFICE OF STRENGTH, AND THE QUALITY OF WORK CANNOT BE EXCELLED BY ANY DISC PLOW AT ANY PRICE

All levers are convenient for the operator, easy to control in raising or lowering plow and for guiding purposes. The bearings are long and made of chilled cast iron, insuring wearing qualities. The foot trip for rear wheel permits the plow to turn either way, and also serves as a raising lever. The method of raising and lowering front furrow wheel is sure to be a source of delight to the operator. It does away with the inconvenient lever in general use, which is usually too long on a two disc and too short on a three disc. The elacticity of the spring board hitch relieves the plow of dead shock and severe strain.

WHITE CITY GRADER CO., BOX D, WHITE CITY, KAN.

HAWKS AND OWLS.

Though in poor standing with the farmer, hawks, owls and other carnivorus birds and animals are not altogether bad, and if they were given the credit they deserve, the good they do would overbalance the harm. In Scotland, some years ago, when war was waged against the hawks and owls because it was thought they were destroying the young pheasants, the damage done by small pests, which had theretofore been destroyed by these birds was far greater than that done among the pheasants. So, too, in Pennsylvania. After the legislature had offered a bounty for a few years on hawks and owls, meadow mice became so numerous and destructive that the law was repealed, and hawks and owls were heartily welcomed.

There is no green vegetation that is not acceptable to the meadow mouse, and when it is considered that they require from 24 to 26 pounds of green vegetation each for a year's support, and that they breed from four to six times a year, with an average litter of six, the damage they might do may be, in a measure, realized.

The progeny of one pair of field mice would in five years number two millions, and this is only prevented by the birds and animals which prey upon them, among which are the owl, hawk, butcher bird, and the wolf, fox, coon, opossum, mink, skunk and weasel. Of course, the chicken-stealing birds and animals must be dealt with summarily when caught in the act, but the chickens are seldom attacked if other food is more easily obtainable.

The Latest Thing in Muskmelons

A New Esculent of Great Promise, Which Bids Fair to Rival the Best We Now Grow, for Either Home Consumption or Shipping Purposes

A NEW MUSKMELON, quite unlike any of the types heretofore known, was brought to the Cultivator office one day last week, and quickly disappeared, we know not where, though the entire office force stated "it is the best we ever tasted."

The specimen in question was picked in October, but owing to its having a hard shell, not unlike that of the Hubbard squash, it was in a perfect state of preservation; and would undoubtedly have kept in good condition for a long time had it not unfortunately (for it) drifted into Cultivator headquarters. This shell, hard as it is, is in no melon examined so much as a quarter of an inch in thickness.

Another equally curious fact, as equally unknown in the melon family, is that this stranger has no seed cavity, the seeds being embedded in the pulp, a fact readily demonstrated in our illustrations.

The flesh is a light yellowish green in color, very fine and jelly-like in texture, with no fiber at all and having a most delicious flavor, and when cut it sends forth a most satisfying fragrance, more welcome than that of any cantaloupe.

Owing to its many excellent points of superiority, we believe this melon is to occupy a wide field, and that with careful management it may be marketed over as long a period as is possible with the hard-shelled squash of the Hubbard section of the family.

The New Melon
Notice the thickness of the flesh from end to end.

It will be especially useful as a late fall melon, long after the casabas "are faded and gone."

Its firm shell suggests that it might be shipped to any part of the United States, or in fact to any point where our oranges will with safety carry. What a delightful fruit it would prove to the proper complement of an Eastern Christmas dinner, where the table was already decorated with California oranges, celery, etc.

The grower gives the following directions regarding the successful growth of the new and unnamed melon.

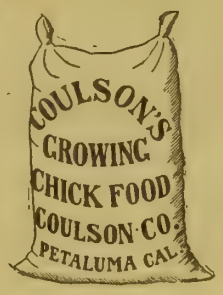
The New Muskmelon

Plant in April or May. Cultivate as other muskmelons, but do not water too generously after first setting of melons is fully grown. Do not pick until the light streaks have become quite yellow. Pick in September or October. They will keep from from three to six months. When stored away these melons become very fragrant, and the rind eventually becomes slightly softened and moist. Then they are ready to eat.

A firm of fruit shippers of Los Angeles says of it: "We need a good muskmelon that can be shipped to the Eastern market for the holiday trade. The casaba hardly answers the purpose, for because of its soft rind it will not carry. Judging by the appearance, the excellent flavor and many other good points, this new melon is just the one the shippers have long wished for. We will handle it just as soon as any can be procured, and predict for it a popular reception."

Another muskmelon that bids fair to make a name for itself is the so-called "rust-resistant cantaloupe" which has been developed in Colorado and will be extensively experimented with during the coming season. In tracing back the history of this strain of seed it was found that some years before a seedsman had saved the first from a single healthy melon taken from a field of rusted vines. It was developed by the simple process of saving the seed from the best melons produced by plants which withstood attacks of rust when surrounding plants were destroyed by the disease. Who knows but the one above illustrated may also prove impervious to attacks from fungous diseases.

The New Melon
Note absence of seed cavity.



Coulson's Growing Chick Food

Is a mash feed for the growing chicks, designed for feeding when you leave off feeding Coulson's Special Dry Chick Food, composed of articles, each the best in its class, combined in the correct proportion to form

A PERFECT BALANCED RATION

It contains blood meal, meat meal, bone meal, and other articles rich in protein, and the other elements, and is the feed you need to make your chicks excel in size and weight and enable them to become strong, vigorous and heavy-laying fowls.

COULSON'S GROWING CHICK FOOD WINS OUT

San Marcos, Cal, July, 23, 1906.
Gentlemen:

I tried COULSON'S GROWING CHICK FOOD exclusively my first year in business on Brown Leghorns. I sold the cockerels as broilers at nine weeks, averaging 2 pounds, 3 oz. each.

I tried my own mixture of feed the next year and took the same care of the chicks, and sold 75 cockerels as broilers, weighing 105 pounds, making an average of about 1 1-4 pounds each.

Having tested at my own expense the two methods I have concluded that COULSON'S FOOD is superior.

Agricultural Education in California

An Essay Read in the Regular Order of Class Work at the California Polytechnic School, San Luis Obispo

By H. F. TOUT

IN THIS age of "doing things," this age when the hand as well as the brain must be trained, it is necessary that educational methods should be established whereby the greatest proficiency can be attained in what ever course of study the individual may choose.

Industrial education is the equal balancing of art and science. By "science" we mean the understanding of "why" certain things take place, while by "art" we mean the knowing of how to put these scientific principles into practice.

I shall deal particularly with industrial education and its relation to agriculture. I do this because the agricultural course has been my selected work, and I can better appreciate the many needs for improvement along all lines of agricultural pursuits.

The present educational system deals almost exclusively with mental and moral training. Industrial education demands that more time shall be devoted to the training of the hand. A verbal exposition upon any subject, no matter how complete it may be, fails to create in the mind of the reader, mental pictures as clear and complete as results obtained from personal work and observation. To illustrate my point: a student reads a graphic description of how a bee, in striving to obtain the honey from some common flower, brushes past the pistil of this flower. In so doing the bee deposits pollen upon the pistil. Upon leaving this flower in search of more honey, the bee carries the pollen from the last flower visited. By this wise provision of nature, that particular species of plant continues to live. Here is the point. That individual may receive no stimulus to investigate the subject from the mere reading of that exposition. But once establish a system of school work whereby the instructor may control the "physical activities directed to useful ends" and compel this student to visit nature's garden and investigate that printed story, then at once a desire is created for further research.

Another illustration of the utility of industrial education. The most accomplished blacksmith may lecture to you for a week upon the principles of blacksmithing. He may explain just how to "upset" the ends of the iron to get the best weld. He may tell you just what the welding heat is, its color, the behavier of the iron, and all the other details, yet I'll wager that not one in this building can make the iron "stick" the first trial. You may have the science of blacksmithing perfectly established in your mind, but with all this knowledge, without the art, you will be a failure as a blacksmith.

In establishing a system of industrial education, a perfect balance must be attained between the mental and the physical training, for until the automatic stage is reached, the workings of the hands are governed by the active operations of the mind. The training of the hand should not be all of the education for any calling. Up to the present time, the work in the schools of rural communities has been lacking in the elements of industrial training. The chief aim has been to acquire mental training and knowledge from books. The use of pencil and pen furnish about the only illustration of "doing" requiring the use of the hand as our educational systems now stand.

To say concisely what I mean, we should introduce into our present school system, commencing with the year, a line of work whereby the hand as well as the mind may be trained. The very first primary elements of agriculture should find a place during these early years of school life.

It may be argued that it is not the business of the common schools to train mechanics, nor to train farmers. It is the duty of the common schools to so train those attending them that they may be more effective and resourceful in whatever line of work they may enter. Nearly one-half of the children in the United States who are in the public schools are enrolled in the rural schools. Ninety-five out of every hundred never attend any other than the district school. The farmer boy and girl is surely entitled to something better than they get. It is time to recognize the fact that a system of rural schools should be planned whereby its course of instruction will fit the needs of the 95 per cent. of pupils who never go beyond the grammar school.

Time will not permit me to go into a thorough discussion of the subjects that should be taught in this newer system of education. I can but mention a few. Commencing with the third year and continuing until the fifth, nature study could be introduced. Under this topic would come, for example, a thorough study of the leaf, its form, shape, color, peculiar position on the stem, and the reason for the same; the different shaped trees, why some are evergreens and others are not. When spring comes the study of flowers as to color, shape, size, odor, and the reason for these. A great multitude of subjects are ever present for nature study. The primary readers could have interesting stories of birds in their natural habitat. Stories of domestic animals and many similar topics could be introduced. After the fifth year, teach something of the nature of the soil and the correct fertilizers to use on particular soils. The treatment of the simpler plant and animal diseases should find a place. Many of these subjects that I have proposed could be introduced into the reading courses and dispense with the present readers.

There has never been a time in the history of this country when arguments for industrial education in rural communities could be presented with such great force as at the present time. Competition is no longer confined to the commercial world. The farmer finds himself face to face with problems of competition as never before.

The government report for 1903 says "that all lands susceptible of cultivation in their natural condition have been taken up, so that this outlet for our growing population is closed. There are, however, vast areas of land which when drained or irrigated can be cultivated." It seems to me, therefore, that somewhere in the farm boy's education he should receive some training in the construction and maintenance of irrigation ditches and reservoirs and the proper surveying out of drains systems.

We have a very notable example in our own State of defective secondary education in the case of the Fresno High School, a school of over 400 students. The colonies south and west of Fresno have become famous as horticultural districts which have been ruined by improper irrigation. The water has risen within three feet of the surface of the ground because of improper drainage and excessive use of water. As a consequence, vineyards, orchards, and alfalfa fields are dying. Boys from these drowned farms attend the High School for four years. There they study Latin, Greek, classics, myths, Greek, Roman, medieval and modern history, and many other nice things to know. The fact remains that less than 5 per cent. of the High School graduates in the United States ever go on to the universities. Hence, 95 out of every 100 of these boys return to the already drowned farms, run more water, foolishly endeavoring to make the poor yellow-leaved vines and trees grow. It is too bad that never in that long four years of hard study the principles of irrigation and drainage have found no place. With a few dollars invested in drainage systems, those now almost worthless farms could be redeemed. But the agricultural department of the State University or the California Polytechnic School are the only places at present in this vast irrigated State where such principles are taught.

A man that would open a machine shop without previous education and training would be a failure. For the same reason many farmers are failures.

The attitude of uneducated farmers is a potent factor in retarding the growth of agricultural education. One of our dairymen here, who had lost heavily because of tuberculosis in his herd, was asked to attend Dr. Ward's lecture on that particular subject. He refused to go, replying, "No, I won't go. I know enough about those durned bugs already." See the attitude. In fact, he did not know the first principle about the disease, for it is not caused by a bug at all, but by a minute plant.

Two years ago a vineyardist with whom I am personally acquainted, had his vineyard seriously ravaged by bugs, those that suck the sap from the leaves. He had read that sulphur dusted on the vines would prevent fungus diseases. At once the forty acres of vines were thoroughly sulphured. The bugs sucked just the same. Upon their departure the army worms laid siege. He sulphured again. The worms chewed away and seemed to grow greener upon the sulphur. Now, almost every one knows that powdered sulphur has no poisonous effects. I have eaten sulphur and sugar many times when I was a boy. Some claimed that it had great virtue as a blood purifier. One thing I do know. It does not possess much virtue as to flavor. But here is the point. That vineyardist did not know the first principles about controlling insect troubles. Had he been taught these simpler truths during his early school life, no such foolish moves would have happened.

I could give you many more examples of lack of training among farmers, but you can see them

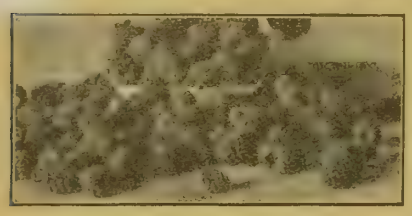
NEWBERT'S PHENOMENAL BERRIES



The most up-to-date berry on the market. They will clear you more money to the acre than any other berry you can grow. $750 clear profit has been made from one acre of these berries. The market price has been from 75c to $1.50 per crate of 16 half-pound baskets. I have taken ripe berries from my vines by the first of May.

Young Plants—I have for sale this year plants that I will guarantee will grow you large and healthy vines. **Prices**—I can furnish large orders on short notice. Price per dozen $1.00, per hundred $7.50.

My plants are rooted from the tips, and will make you a strong and fast-growing vine. Order at once to ensure delivery.

Deciduous Fruit Culture

By J. W. MILLS

French Prunes

THE increased profits derived from prunes during the past two years have stimulated interest in the fruit again and some of those who cut out their trees now wish they had them back again. The increased interest in the prune, brings many inquiries from numerous prospective planters. The best variety and etc., are old items to the average California prune grower. We one time admired the enthusiasm of a man newly from the East, who had bought a small farm on which were a few French prune trees. When his prunes were ripe, he brought us a sample and asked us of we ever tasted such a sweet and delicious prune as that sample. It was an ordinary, rather poor grade of prune, grown on very poor prune land. It is this class of new farmers that want to know about prunes.

The principle prunes grown in California are the Prune de Sargent and Prune d'Agen, the leading French prunes of commerce. They form the great bulk of prunes raised in France also. The Imperial prune is also raised quite extensively in Central California, but the bulk of the orchards are the older orchards of the two first named varieties.

Imperial prune makes fancy goods, which bring the top prices, but the trees are not so productive as Robe de Sargent and d'Aden. It is not a profitable prune in Southern California as the tree is a very shy bearer there. Splendor has the same fault besides being smaller in size than the ordinary prune. In the Sacramento valley, Splendor will break the trees down if not propped.

Sugar Prune promised to be a winner, but Imperial leads it now and no doubt always will as a cured prune fruit. It is a hard tree to manage as it is extremely brittle and the fruit is exceedingly susceptible to cracking in some localities. It is a very slow grower compared with other varieties in some sections and is very much of a disappointment in such places. It is one of those examples where strict attention to the adapability of varieties to section is imperative. This is always an important item to consider, but in the case of Sugar and Splendor prunes, it is doubly so.

PLANTING THE PRUNES.

Wickson advocated some years ago, that prune trees should be planted with the entire top left on, instead of cutting it like other trees usually are at planting time. The old way was to cut all the newly planted trees at one height, which forced out a cluster of branches near the top. This makes a handsome tree for several years, but when the tree arrives at the advanced bearing age, few will carry a load without splitting. It is hard to estimate the amount of damage that has been done through the mistaken idea that the prune should be cut back to eighteen or twenty inches. Wickson's method gives the tree a chance to send out branches in natural positions and at such angles as will make a strong fork.

The French prune does best on peach root when planted on deep soil that has good drainage. When planted on soil that is subject to standing water or where the drainage is poor, use Myrobalan roots.

The usual methods used in preparing land for orchard purposes as has been described recently in these columns, applies to the prune orchard. Trim the roots on the ends where they have been bruised when taken from the nursery. Have the holes large enough to accomodate the roots well spread out. This method is superior to the Stringfield system in this State. Do not pinch back the new growth on the trees during the first summer's growth. The young trees may look ungainly, but the open spaces will fill up and nipping the ends of the strongest growing branches of any young tree will retard its growth. We have experimented on that point to our entire satisfaction. Ever ounce of sap that runs through the branches of a tree, will increase the size of the trunk that much more, and when you commence to check the full flow of sap that the strongest branches induce, just so much is lost in the stockiness of the tree.

THE MISSION OLIVE.

The Introducer.

Historic records tell us that the olive tree was introduced into California in 1769, from San Blas, Mexico, by an expedition of Franciscans sent to take charge of the Jesuit missions in California.

It appears from the ship's manifest that one José de Galvez, who was "Visitor-General" and secular head, with Father Serra, proceeded to make arrangements for the establishment of settlements. He seemed to be farseeing, for it was found that he had caused to be shipped to "Alta" California, flower, vegetable, and fruit seeds for garden and orchard, and grain for the field. The ship's manifest does not show that any trees or cuttings were brought.

The First Planting.

The first seeds of the olive are said to have been planted at the Mission San Diego, and those seeds (which Galvez had been so provedent in sending) grew and prospered. The Fathers built new missions, and among the first trees planted was the olive, grown from cuttings taken from trees of the San Diego mission.

All the mission orchards were very small, and some had but few trees, but those trees played an important part in the horticultural history of our State, for they laid the foundation of a gigantic indrusty and furnished stocks for many groves, which today may be styled the "prehistoric" orchards of the State.

Many Types.

For many years, a century or more, only one variety of olive, the "Mission," so called from its having been first grown at the various historic missions, was known in the State. Many of those trees still live and bear remunerative crops under favorable conditions. That the larger part of these primitive trees were grown from seed there is but little doubt, for in almost every mission olive orchard there are trees growing side by side of entirely distinct types.

Some are of a willowy habit, the fruit large and roundish, which matures

With the Citrus Growers

By J. W. MILLS

Light Pruning

REGULAR pruning in the orange orchard should be done right after the fruit is cleaned up. In the case of Valencias, this comes after the new crop is nearly grown. Some green fruit is bound to be sacrificed, no matter when it is done even with navel trees. A large grower in Orange county leaves a few empty boxes scattered through his orchard after the picking, and his pruners follow with picking bag. Every tree is carefully gone over and the stray oranges that even the most careful pickers overlook, are gathered and put in the boxes. This often greatly reduces the cost of pruning as it comes during the season of high prices that this work is done.

The pruning of bearing trees that are in good condition should be confined to cutting out branches and twigs that are on the wane. Such branches are often tipped with a few healthy leaves, but when they are down in the center of the tree they cannot long survive. When the outer branches are open enough to admit a little sunshine, these small branches will bear some fruit of fine quality. On the other hand, if a tree is too open, especially a navel tree, the fruit will be lighter in color. There is a balance to be struck that can only come with experience. This feature does not enter so largely into the Valencia as it is naturally a lighter colored orange. Then again soils have a great deal to do with the color of oranges, independent of pruning.

The pruning of frosted young growth on young trees and buds need not now be pruned as the frosts that are to follow will no doubt kill them some more. At the end of the cold season, all affected growth should be cut back below the seared point. Such wood may start new branches, but the growth will be slow and more is gained by getting down to strong buds.

INFLUENCE OF SOIL ON COLOR.

Last year we had occasion to note that part of one orchard that produced a magnificent crop of oranges, as smooth as any Thompson's Improved, but with a thinned skin, fine textured pulp, full of juice and heavy, could not turn out two per cent. of fancy fruit on account of color. A part of the same orchard produced more fancy fruit, but not so fine in texture. The difference was apparently due entirely to the soil. The light colored fruit was on soil that was over fifty per cent. gravel. The higher colored fruit in the same rows was on soil with some clay and less gravel.

One striking feature that knocked some pet theories regarding the cause of puffing and splitting, was in evidence in this orchard. Thin rinds on an orange are supposed to be more liable to split than a heavier rind, and that splitting and puffing of the orange are due to two distinct causes and are results of causes due to diametrically different forces and attributes. In this same orchard we found thick skinned oranges that were puffy. Near by and in the same row were the thin-rind oranges that were puffy and across the puffy parts were cracks, showing that it was not due to a tight skin.

There is more in the feed than the breed.—Exchange.

And more in the feeder than in either.—Kansas Farmer.

CITRUS CULTURE.

The culture of citrus fruits has become the leading industry of many districts of California, and it is being developed with surprising skill and energy by very capable horticulturists, some of whom have been almost a lifetime in this occupation. It is therefore essential to the truthfulness of any inquiry into the present problems of citrus-fruit culture that a wide range of observation should be taken.

M. J. W. Mills, foreman of the Pomona substation since 1893, and now at Riverside, was therefore sent out, in 1902, to visit some of the best orchards in leading orange districts of Los Angeles, San Bernardino, and Riverside counties, and to compare the staton experience with that of successful commercial growers. The results possess interest for those who wish to plant citrus fruits in any part of California, since the conditions of soil and climate at Cloverdale, Calistoga, Palermo, Porterville, and other northern and central orange-growing points, while in some respects quite different from those of the southern orange-growing counties, are sufficiently similar to make careful observations in any part of California valuable. Much more complete studies of local conditions have been made in the southern citrus districts than in other parts of the State, and some of the conclusions reached need modification as respects northern districts when an equal amount of local experience shall have been there accumulated. Based on these studies and those of recent years, are all of Mr. Mill's writings in the Cultivator; which are invaluable to all citrus growers.

In citrus fruit districts the high price of land that is known to be well situated, of the best quality, and supplied with water, leads men to extend citrus culture far beyond its natural limits, upon unsuitable soils and into frosty localities. The marked recent advance in average prices of citrus fruits and of wellplanted orchards has also caused hasty and careless planting, even in well-established districts. Many old trees are bearing less satisfactory crops than heretofore, and various plant diseases add to the anxiety of the orchardists. Technical knowledge and a high degree of horticultural skill are every year more essential to the prosperity of each individual orange-grower.—Ed.

MANDARIN ORANGE HISTORY.

Several gaps occur in the history of these oranges, and yet it has been possible to trace it with a fair degree of accuracy. The first mention of an orange which is believed to belong to this group is in Sterbeeck's Citricultra, where it is mentioned as the "Muscat apple."

It is well within the limits of probability that some member or members of the group were known to Rumphius and indeed Lourerio, in his original description of Citrus nobilis in 1790, refers to this possibility. Referring to the the same dates and cuts, Bonavia comes to the conclusion that the Aurantium sinense of Rumphius must be grouped with the suntara oranges of India. Having carefully read the description written by Rumphius, both in the original and as translated by Bonavia, and after comparing it with specimens of the Rangpur lime, grown by

200% INCREASE

From The Los Angeles Times, Nov. 23, 1906:

"Truman Berry has just completed the picking of ***lemons*** from a four-acre East Whittier orchard, getting over 1200 field boxes from the four acres. This is considered something of a record, as the orchard was gone over thoroughly just one month ago. The average yield per acre is something like 100 field boxes for each picking, this being considered a good record. Berry's record is therefore ***three times the average yield*** and goes to show how California soil will repay careful and intelligent effort on the part of the rancher."

WAGONS

There is always one by which the rest are judged. Ask any farmer which wagon he places the most confidence in; ask any expressman which wagon lasts the longest with fewest repairs. The answer will be,

The Studebaker

No one ever claimed to make a better wagon than THE STUDEBAKER. It couldn't be done. Many are said to be "just as good." If none is claimed to be better by the competitors, and the Studebaker is looked up to as the standard, isn't it pretty good evidence that it is the best?

Every wagon put out by the Studebaker factory is as near perfect as it is possible to make it. Everything from tongue to tail-board is of matchless superiority.

Don't waste money on an inferior wagon, but begin right and get a STUDEBAKER. These wagons, in various sizes, may be seen at the large salesrooms of the

EARLY LAMBS

Early lambs will bring big money if you save them, and get them to market at the right time. Give them a little of Dr. Hess Stock Food in the grain they eat—then, if you keep them warm and dry, there will be no losses, and they will be "fit" at the very moment when prices are best.

DR HESS STOCK FOOD ATONIC

the prescription of Dr. Hess (M. D., D. V. S.) contains bitter tonics for the digestion, iron for the blood, nitrates to expel poisonous material from the system and laxatives to regulate the bowels. These ingredients are recommended by Professors Winslow, Quitman, Finlay Dun, and the most noted medical writers in the country. It is not a food in itself, but makes all the food of the farm produce more milk, more meat and more work by increasing digestion and regulating the system generally.

Sold on a Written Guarantee.
100 lbs. $7.00
25 lb. pail $2.00
Smaller quantities at a slight advance.

Where Dr. Hess Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our Government recognizes Dr. Hess Stock Food as a medicinal tonic, and this paper is back of the guarantee.

If your dealer cannot supply you, we will.

MOLINE PLOWS AND OTHER FLYING DUTCHMAN FARM TOOLS

Southern Chief DISC PLOWS

Built with Special Reference to the Requirements :: of PACIFIC COAST Farmers and Orchardists ::

These plows are made entirely of steel, malleable and cast iron. They are well braced, strong and easily controlled. The three disc can be converted into a two disc, and the four disc is easily changed into a two or three disc. A farmer having a two disc can make a three disc by securing the extra parts.

LEVER RODS SLIDE THROUGH ADJUSTABLE CONNECTIONS
Keeping the Levers and Operator Always in the Same Relative Positions.

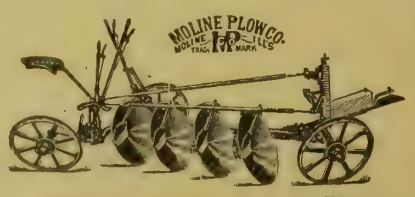
The location of seat, wheels and hitch are right, giving good penetrating power and permitting of turning to either right or left. The front wheel is under control at all times and the plow can be steered at will.

The Orchard Axle Attachment

with which either size of these plows can be equipped is a splendid thing for orchard plowing, and especially where it is desirable to work up under the branches close to the trees.

Permits of Closer Work than Can be Done with a Walking Plow

The plow with this attachment can be used for general work as well as for orchard plowing.



Made in Two, Three and Four Disc

SIMPLE WITHOUT SACRIFICE OF STRENGTH, AND THE QUALITY OF WORK CANNOT BE EXCELLED BY ANY DISC PLOW AT ANY PRICE

All levers are convenient for the operator, easy to control in raising or lowering plow and for guiding purposes. The bearings are long and made of chilled cast iron, insuring wearing qualities. The foot trip for rear wheel permits the plow to turn either way, and also serves as a raising lever. The method of raising and lowering front furrow wheel is sure to be a source of delight to the operator. It does away with the inconvenient lever in general use, which is usually too long on a two disc and too short on a three disc. The elacticity of the spring board hitch relieves the plow of dead shock and severe strain.

ASK YOUR DEALER TO SHOW YOU THESE PLOWS

Send us your name and address, enclose four cents in stamps to pay postage and mailing, and we will send you our Flying Dutchman Song Book and Junior Catalogue Combined, containing Twenty-six Old Familiar Songs with words and music.

Butter Making

A cows milk is fit to use after the ninth milking from calving time, to make it certain that the milk is not sold too early the ordinances of many cities reads that milk may be sold after the fifth day. Old country folks often regard the first milk as a delicacy, using it to make a form of custard. In America. it is used to clean out the bowels and start the gastric juices in the newly born calf. The newly born foundlings of the human family are often saved from death by the first milk from the cow half reduced with water. The horse breeders recognise that a colt which once nurses is born all right! and must be paid for by the owner. This is "old wives" talk. A newly fledged writer tells us that this first milk it filthy and that it is folly to use it for the newly born animal, that it is barbarous. I told Carl this, Carl has fed the cows for twenty years at the ranch. He said; "Did you read that in the paper? Well never mind; when people write for papers they is always folks that don't know nothing!" I meekly replied "Well that is too bad Charley!"

As soon as the milk is fit to use begin to make butter, if there are two cows, one fresh and one longer in milking, it will be found more ecomonical to use the milk from the cow longest in mlk, for the table, and set all the fresh cows milk for skimming. The loss is considerable if the two are mixed for under ordinary conditions the cream is not evenly ripened and the butter fat is lost in the butter milk. The fresh cows milk will cream more easily, as the milk is more fluid, often in the milk of cows not fresh, there seems to be an albumen that prevents butter fat seperating completely. When a separator is used practically all the fat is recovered, from milk of any class.

Keeping Milk Pure.

When the milk is set in open pans a special room free from odors should be used, if possible a room whose walls can be freely whitewashed. The room under the tank is often used for this purpose. The windows should have screens to keep out flies and also windows of glass to keep out the dust and rain. A large trough filled with water to stand the cream can in, as well as to use to chill the milk, is desirable. The changes of temperature act more slowly when the cream is held in water than when it stands in the open air. When dampness troubles the room a box of unslaked lime standing on the floor will remove the mouldy tainted smell from the air. By taking up the moisture the room is made sweet and wholesome.

While is may not be ecomonical for every one to have a seperator the woman who has only a house with a few people in it to look after and has time. I believe would find it to her advantage to have a separator. The point with me would be that of health. I believe it is rare that milk skimmed from pans is not placed in rooms the temperature of which must in a degree interfere with its purity. The small separators are not expensive and would last many years when used by careful hands. The daily washing of pans is no small task especially where a woman must heat all the water used on an ordinary stove. The separator gives a smooth sweet new cream that is vastly superior to the lumpy cream just turning sour from the pans. To any one used to separator cream the other is hard to use even in the coffee for breakfast, and not liked at all on fruit or mush.

Use Of Pans.

I suppose the use of pans will continue, as many women's time is not thought of value by their husbands and unfortunately the spending of the money earned by the man and saved by the woman is left to the husband. So the mowing machine is purchased and the separator is an extravagance.

The tin-ware, pans, cans, milking pails sometimes have rough places but not as often under the present machine soldering, still I always look them over carefully, then weigh them, make the cans all of the same weight by dotting them on bottom with solder. Have the milk pails done in the same way so that weighing once settles the accounts. When any can is full of milk the same tare is to be allowed on each, This is to simplify keeping the amount of milk it will hold without having to weigh it each time.

The use of soap and cloths for wiping milk utensils is all wrong, throw them out the windows to make fertilizers, for to each of these are to be traced many of taints in the milk. The virtue of soap and soap powders seem now to excercise the minds of the men instead of preservatives. The basis is after all sal soda or borax, these are cheap when bought in themselves, but when a fancy cartoon printed in red green or blue is added, the price becomes even higher than the coloring of the wrappers.

Plain sal soda sells cheap, a couple of cents a pound by the barrel. Now in using sal soda it does not have to be as strong as it is usually used for good results, the washing powders are as strong as people commonly use plain sal soda. The large amount of fillers in the powders make them deceptive as to the amount of actual strength of the alkali used.

Good Formula.

When the sal soda is used too strong it eats the hands and often causes the user to buy a weaker soap powder, I have a general mixture that is excellent for cleaning tin, wood that is not painted and iron pots.

One part of concentrated lye.

One part of borax.

Ten parts of sal soda.

Put it dry into screw top jars. Add a heaping tablespoonful to two gallons or more of hot water.

When milk is emptied out of the pans fill them first with cold water, run the china splint brush around them to start any hardened cream, then fill them with hot water containing the washing powder, and use the brush on them to make them clean, then rinse in warm water, if hot water is abundant scald in water as hot as possible and and stand up to drain dry. When hot water is scarce I used to slip the pans upside down on the oven floor to bake dry. Keep the pans bottom side up when not in use as the dust of the atmosphere is bacteria ladened and it settles into the upturned utensils. Before using always rinse with clean water the pans and pails using them wet or without wiping.

For a Good, Practical Milking Machine see the O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

HOW MILK BECOMES CONTAMINATED.

The following suggestions, given in a Storrs (Ct.) bulletin are of interest and value:

Feeding hay and dry grain just before or at milking time fills the atmosphere of the stable with dust. This dust then settles into the milk pail, carrying bacteria with it, thus increasing the germ content of the milk.

Feeding dry corn stover just before or at milking time has the same effect as the feeding of hay and grain, only in a more marked degree, since corn stover usually contains more dust and bacteria than does hay or grain.

Wiping the flank and udder of the cow with a damp cloth just before milking is a very efficient method for reducing the number of bacteria which fall into the milk pail.

The practice of brushing cows at milking time is undesirable. The hair and dust which are thus set free into the atmosphere settle into the milk pail during the process of milking and very materially increase the germ content of the milk.

Stripping a cow dry tends to reduce the number of bacteria found in the milk at the next milking while leaving a small amount of strippings in the udder increases the number of bacterin which the milk will cantain at the newt milking. This is probaly due to the fact that the greater manipulation necessary to thoroughly strip the cow removes the bacteria which would otherwise remain in the udder to multiply during the time before the next milking.

In order to remove the surplus of bacteria existing in the milk cistern it is necessary to discard the first five or six full streams of milk from each quarter of the udder. The removal of the fore milk results in a slightly smaller germ content of the remaining milk, but the difference is so small that this practice is probably only valuable where an extremely low germ content is desired.

The intelligence and personal habits of the individual milker are an important factor in determining the germ content of the milk. This factor must be taken into account in the production of clean and high grade milk.

GOOD HORSES DEMANDED.

Mr. F. M. Douglass, a Los Angeles banker, traveled over a good deal of country in the East, this fall, looking for a string of horses, for himself and friends, to ship to Southern California. He found it difficult to purchase the grades he desired and in every instance found well bred driving horses very high in price. Another Los Angeles party tells us that he traveled through Iowa and Nebraska, in search of a carload or two, of first-class draft horses for the San Francisco market and found it a difficult matter to obtain what he wanted. In some instances $500 were paid for young, well-matched teams, and most of the horses purchased brought as high as $200. We were informed by this buyer that even at these prices the farmers were very indifferent and seemed unwilling to make sales. In one instance he met a man who had a fine pair of well bred grade Percherons and was asked if he cared to sell and at what price. The farmer replied that he would sell, but wanted $450. After looking the team over, the buyer concluded he would take the team and pulled out his check book. A puzzled expression came over the farmer; he grasped the lines, and without another word drove off, to the buyer's astonishment.

These instances are only individual, but they indicate the growing demand for good horses and their scarcity. We have for a long time felt that notwithstanding the introduction of automobiles, bicycles, etc., that there would be a great demand for good, sound horses weighing from 1300 to 1500 pounds. As cities grow and agriculture prospers and expands, the need of horses will be felt, and we are glad to note that the farmers of California are preparing for this demand. Good draft stallions have lately been brought into most of our farming sections, and while the price paid has in many instances been beyond reason, yet it is a good indication. There is money in good horses, and we hope to see California farmers get their share.

Most farm work can be done as well with mares as with geldings, and the farmer who does not keep a few span of breeding mares on the farm raising colts each year is neglectful of his own interests.

EGGS-PLAINED.

A duck who had faithfully stuck to business during the summer and laid several dozen large fawn-colored eggs complained that she was not appreciated. "See that hen over there?" said the duck; "she has not laid so many eggs as I have, nor so big, but she has books written about her and verses composed in her honor, while nobody says a word about me." "The trouble with you is," said a wise buff Leghorn cock, that was standing near, "that you do not tell the public what you have done. You lay an egg and waddle off without letting anybody in the neighborhood know it. If you want to cut any ice in this community you must learn to advertise."

FIGS FOR A COUGH.

A sirup of figs made by putting one-half of a pound of cut sugar to a pound of figs and simmering in as little water as will cover it till it is soft enough to strain, is excellent for a cough. Take a teaspoonful of the clear syrup three times a day. It is simple and easily prepared and has performed some very interesting cures within the personal knowledge of the writer.

"Yes, I saw Dumley yesterday just after his fight with Biffer."

"How did he look?"

"He couldn't.' '

Free Subscription to The Large Illustrated Paper For Dairymen—The Separator News. A big paper, handsomely illustrated in colors, entirely devoted to the success, prosperity and protection of separator users and intending separator purchasers. Every issue brimful of special illustrations and information—what might be called inside facts—that will help you to decide whether a cream separator will pay you, how large a separator you should have and how to care for a cream separator so as to get the most out of it. Articles guarding you against the "patent can" fraud and against the mistakes of buying a too cheap or too complicated separator. Articles telling what State Experiment Stations say of cream separators. Articles comparing different kinds of cream separators. In fact, a whole paper devoted to cream separator news. Would you like to receive every future issue—without a cent of expense to you. Then write the publishers, The Sharples Separator Co., of West Chester, Pa., asking them to put your name on their mailing list. But don't forget to mention that you saw this offer in the California Cultivator.

ORIGIN OF THE FLYING DUTCHMAN TRADE MARK.

WHILE the Flying Dutchman, the trade mark of the Moline Plow Co., Moline, Ill., is familiar to farmers of every quarter of the globe where modern farm machinery is used, comparatively few know of its origin and the reason it was accepted as the trade mark of the company.

When the Moline Plow Co. originated and patented the three-wheeled riding plow the types then in use were cumbersome two-wheeled horse-killing machines which were difficult to operate and dangerous to ride upon. The three-wheeled riding plow became at once so immensely popular that it created great consternation among other manufacturers, who, of course, were not in position at that time to compete for that class of trade. In casting about for a name suitable for this invention, which, by the way, will go down in history as a landmark in the manufacture of farm machinery, the Flying Dutchman was suggested. That was the name given by sailors to a phantom ship supposed to cruise in storms off the Cape of Good Hope. There is a tradition that a Dutch captain, bound home from the Indies, met with long continued head winds and heavy weather off the Cape of Good Hope. Instead of putting back, as he was advised to do, he swore a very profane oath that he would beat round the Cape if it took him until the Day of Judgment. He was taken at his word and doomed to beat against head winds for all time. Sailors, being very superstitious, were always terror stricken when overtaken by a storm at the Cape, fearing they would encounter the phantom ship. The fear the sailors had of this ship and the fear competition had of the plow seemed to make the connection and it was decided to name it the Flying Dutchman. The tool being so popular and the invention to important, an artist was employed to work up the thought. The first posters portrayed a scene at sea, showing a large phantom ship coming out of the mists and bearing down on the smaller craft to their consternation and fear of destruction. This idea, however, did not please the Plow Company and perhaps was not a joyous thought for their competitors either, and it was concluded to abandon this association. In casting about for something which would be more modern, more humane and more happily portraying the value of the device, it was finally concluded to adopt the Bartholdi Statue of Liberty standing in New York Harbor, changing, the statue, however, to conform to the idea of a Flying Dutchman, and the result is a trade mark that is perhaps as well known today as any in the world.

STRENGTH

DURABILITY

SIMPLICITY

A cream separator that is worth buying must give **long service.** To do that, it must be built strong and the **construction** must be simple. To have simple construction in a separator you must have a Sharples Tubular. There is no other cream separator made that will perform its work so well for so long a time as the **Tubular** because there is no other separator so strongly built, or so **simple** in construction.

Sharples Tubular Cream Separators

get all the cream, have low supply can, are easy to run, easy to clean, because there is only one little piece in the bowl to cleanse after each running, and the machine oils itself. It combines **Utility, Simplicity** and **Durability.** A glance at the pie-plate construction of most separators will give you a fair idea of what we mean by "simple construction" and "strength." For full information about the Sharples Tubular write for booklet E. 260

Mr. R. Carpenter, Davenport, Wash., says "Having used a Sharples Cream Separator over sixteen years can say it is just fine."

FEEDING LIVE-STOCK.

It is possible to compound feeds that, while they would answer the needs of the chemical standard, they would be deficient in those elements that would be appetizing to the animal. Consequently, in a large measure, the feeder must select those feeds that the animal will partake of most freely.

There are five things that the feeder must have in mind. First, palatability of the ration; second, efficiency of the feed to accomplish the desired results, whether it be work, fat or milk; third, cost of the feed must be considered, for on this depends the profit that will be derived from the feeding of any sort of live stock; fourth, the relation between efficiency and cost of feed must always be taken into consideration, and fifth, the effect of the ration upon the animal.

There is such a thing in feeding as the nutritive ration, that the feeder must consider. This will vary during the course of feeding. For instance, at the beginning the animal may be fed a wider ration than at the end. In other words, speaking generally, the ration at first of the feeding may be such that the foliage will be three times the grain; but at the end the proportion may have changed so that the animal will be receiving three times as much grain as roughage.

In many cases the purchase of expensive feeding stuffs, like cottonseed meal, oil meal and gluten feed, are unnecessary and otherwise expensive. The farmer has it within his power to avoid this proposition by supplanting these by growing and feeding protein roughages such as clover, alfalfa, soy beans, cow peas, etc. As a matter of fact, the farmer may as well conclude that the cheapest feeds that he can secure to produce the desired balance between the carbohydrates and the protein is any of the nitrogenous roughage.—[H. W. Mumford, Illinois Experimental Station.

RATIONS FOR COWS.

In this age of experiments we are likely to meet with some very valuable hints on dairy feeding. All may not be practical. The balanced ration for the cow has been shown to be productive of excellent results. The cow that is fed on a balanced ration is more sure to give the most and the best milk.

Here is a suggestion for a balanced ration:

1. 5 lbs. bran, 5 lbs. corn, 20 lbs. alfalfa hay.
2. 6 lbs. corn meal, 4 lbs. bran, 20 lbs. alfalfa hay.
3. 4 lbs. corn, 1 lb. oil meal, 6 lbs. bran, 10 lbs. corn fodder and 10 lbs. wheat hay.
4. 3 lbs. gluten feed, 2 lbs. corn meal, 3 lbs. bran, 2 lbs. oil meal, 20 lbs. silage, and 10 lbs. wheat hay.
5. 4 lbs. ground oats, 4 lbs. bran, 20 lbs. alfalfa hay.
6. 5 lbs. corn, 1 lb. cottonseed meal, 5 lbs. bran, 40 lbs. silage, 15 lbs. oat hay.
7. 2 lbs. oil meal, 4 lbs. corn meal, 4 lbs. bran, 10 lbs. oat hay, 10 lbs. oat hay.
8. 10 lbs. bran, 5 lbs. oats, 15 lbs. oat straw.
9. 10 lbs. alfalfa hay, 10 lbs, millet hay, 4 lbs. oats, 8 lbs. bran.
10. 8 lbs. bran, 2 lbs. oat meal, 2 lbs. corn meal, 20 lbs. silage, 10 lbs. barley hay.

Cream Separators, all sizes, all prices. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

It will not be necessary to weigh the ration each time, for after mixing two or three feeds one can guess pretty closely at the proper amount to use.

THE GOOD COW.

Prof. T. L. Haecker of the Minnesota Agricultural College gives the following pointers for the selection of a good dairy cow: "It does not matter whether the udder goes well back or not, or whether it is large or small. Look first at the body or barrel, to see if that is large and deep, as this is the measure of the cow's ability to store, digest and assimilate food. Next look at the thigh, to see what disposition she makes of the food, beyond the amount necessary for support. The more the rear line of the thigh curves in the cheaper will the cow produce each pound of butter. If she has a large barrel, the food will go there and something will be done with the food nutrients. If the cow is fleshy and blocky, she puts these nutrients away as tallow in her tissues. If she is spare, angular, ewe-necked and cat-hammered, she turns the nutrients into milk solids and puts them in the udder. If the udder is large, she puts large quantities of water in it with the fat and other solids. If the udder is small, she puts the fats and other solids in the udder, because there is no other place to put them and puts less water in the milk."

Prof. Haeckler says that for six years every pound of food given to each cow at the Minnesota college has been weighed and every pound of milk and butter fat produced from the food has been weighed and recorded and the facts, without a single exception, are as stated. Prominent milk veins, dished face, yellow ears inside, slim tail, full, square udder etc., he declares are of no value. The only thing to know is that the cow has a spare deep frame and small thin quarters.

DAIRYING IN ITS INFANCY.

Prof. J. L. Haecker of the Minnesota College of Agriculture and Experiment Station is quoted in the Owatonna Press as follows:

"The dairy industry in the West is still in its infancy and we confidently look for even more rapid growth in the future than it has made in the past. The time is not distant when Minnesota alone will derive an annual income from this one industry of $50,000,000. We will invade not only the eastern but the foreign markets. We can produce better and cheaper butter than can Denmark or any other country, for they all must look to America, and especially to the Northwest, for their feed stuffs, and whenever we can convince the western grain grower that it is to his advantage to convert his surplus feed into butter, ship the more concentrated product, realize a greater income and at the same time improve the fertility of his farm the change will surely be made."

BETTER THAN BANK NOTES.

The farmers in the East have learned that pure bred hogs will beat the bank on interest rates. We can not recommend any one breed over another, for any of them are good. Try Berkshires, Poland-Chinas, Chester Whites, Ohio Improved Chesters, Yorkshires—any breed will give you better returns if properly handled than the best investment the banker ever makes.

THE MISSION OLIVE.

(Continued from Page 28.)

early and evenly; others are tall, lofty, sturdy trees, bearing elongated fruit and of very uneven ripening; while still others are of a dwarfish habit of growth, the fruit small and of very little value. It is not uncommon to find olive plants that have sprung up spontaneously under trees from pits of fruit that dropped, especially where the soil had not been disturbed for a season.

THE BEGINNER'S ORCHARD.

The Stock.

Good stock should always be insisted upon. Such stock does not necessarily call for the largest plants of the kind that can be secured, but should consist of strong, healthy plants of fair size for the age, with good roots and typical of the variety. It is false economy to secure low-grade stock simply because the first cost is a little than less than that of better grades.

Preparing the Land.

Land can not be too carefully prepared before it receives the plants. This is especially true where strawberry plants or other small fruits are to be set out. The soil should be as thoroughly pulverized as for a seed bed. Of course, in the case of orchard lands the most of the surface can be readily worked after the trees are planted, but in most cases it will be found more satisfactory to attend to all such details before any of the ground is occupied by trees or plants of any kind.

Setting the Plants.

If extensive areas are to be planted it will often be found economical to make furrows along the line of the rows, and of sufficient depth to receive the plants, though this is one of the many details that is a matter of personal preference. The essential feature of the operation is to make the holes that are to receive the plants sufficiently broad to take the roots without bending them from their natural positions, and deep enough so that when they are refilled the plants shall be somewhat deeper—in the case of most kinds of trees, two are three inches—than they were in the nursery row. But in setting out strawberry plants and others of similar nature care must be taken not to cover the crown of the plants. The soil needs to be packed about the roots very firmly.

Before setting in the ground, all mangled or bruised roots should be removed and the tops cut back proportionately to the amount of the root system that has been lost. It is the practice of some growers in setting trees to trim to a mere whip by removing all the side branches. With peach trees this is the more usual custom, unless the trees are very large.

The practice which is quite common, especially among small growers, of placing a quantity of manure in the bottom of the holes before setting trees is not one to be commended. If the manure heats, it is likely to cause the drying out of the roots, thus defeating the very object of the intended extra attention. It is better to have the soil uniformly in good condition before planting the stock.

Andrew Reid, of the Hesperia hill section has a Picoline olive tree that will net him $20 this year. The Picoline olive is at home in the Hesperia hills. Fifty of these trees per acre would be $1000.

The Vegetable Garden

By ERNEST BRAUNTON

Garden Soils

A DEEP soil of good tilth will absorb and hold for the use of plants a large part of the rainfall. Such soil is in good condition for the growth of common crops.

Soils can be put in the best of tilth, when in proper state of moisture, by deep plowing, disking, and harrowing.

Evaporation from soils can be lessened by covering them with mulch. The best mulch and the only practicable one on a large scale, is a soil mulch. This can be produced and maintained by surface cultivation. To be most effective, the cultivation must be repeated after rains that puddle the surface soil.

In semiarid regions special effort should be made to utilize the rainfall. The ground should be plowed soon after the removal of a previous crop; it should then be settled and smoothed. By frequent cultivation of fallow land, moisture may be stored for a crop the next year. In this way crops have been grown in semiarid regions once in two years when crops every year on the same land have failed.

In dry climates the corn crop succeeds better when put in with the lister. It roots deeper, stands up better, and the work in growing a crop is less than when planted in level-plowed soil.

Strains of plants that have originated or been grown for many years in dry climates should be selected for the semiarid regions, and the rate of seeding should not be more than one-half that common in humid regions. Stronger, better-rooted, and more hardy plants will thus result.

Organic matter should be maintained in soils to improve their physical condition. This may be accomplished by green manuring, and by the plowing-in of manure, straw, stalks, and other vegetable refuse.

Leguminous crops, such as clover, alfalfa, and cowpeas, used as green manure, not only increase the humus of soils but supply nitrogen from the air. This is the cheapest way of adding this important fertilizer ingredient.

Anyone who proposes to begin gardening without irrigation in a region of light rainfall should be properly cautious. He should not be misled by glowing accounts of large crops; he should investigate carefully the possibilities of the particular region in which he expects to settle; he should have clearly in mind beforehand the kind of crop which he will produce, and he should not undertake the work, if a failure of crops at the beginning will mean to him complete and permanent disaster. It should be clearly understood that gardening in the semiarid regions, without irrigation, can not in the nature of things be as certain or as profitable as gardening under favorable conditions in the humid regions.

CUCUMBER DISEASES.

The next important step in the production of cucumbers is constant watchfulness for the appearance of blight or mildew, and immediate, thorough treatment when discovered. These diseases are of almost annual occurrence throughout the southern trucking regions, though not very common in California, and growers of cucumbers should plan to make the spraying of the plants a regular feature of their cultural work.

The subject of disease is, however, of such great moment to the truck grower that the general preventive treatment for blight and mildew should be mentioned at this point. This consists of thoroughly spraying the plants with Bordeaux mixture once in ten days or two weeks after they have begun to run. Bordeaux mixture is made by bringing together the milk of lime and a solution of copper sulphate (bluestone.) For cucumbers it has been found that a mixture made from 3 pounds of copper sudphate and 6 pounds of freshly burned stone lime to 50 gallons of water makes the safest and best solution for this work.

IRRIGATING ONIONS.

In arid regions, immediately after the onions are set out, they must be irrigated, and this should be followed with a second irrigation in about seven to eight days. Usually it takes about two irrigations to establish the little plants. The subsequent irrigations will vary more or less, depending on the soil and climatic conditions. Other things being favorable, the time between the irrigations to get good results, should be about every eight or twelve days. Since the onion is a surface feeder, it is very desirable that the uper portion of the soil be kept moist and cool.

MUSHROOMS AS A MARKET CROP.

Only the so-called 'cultivated mushroom," Agaricus Campestris, is grown for market. The culture is very easy and almost any one can succeed at it.

This mushroom thrives best at a steady temperature of about 55 deg. F. to 65 deg. F. The temperature must not fall below 50 deg F. nor rise above 70 deg. F.

In France and England this mushroom is extensively grown for market in sheds, stables, cellars, disused quarries, mines and caves it is also grown during the fall months out of doors in garden-beds, kept covered from direct sunlight. Mushrooms do not require sunlight as green plants do, but ordinary diffused light will do them no harm, though direct sunlight is injurious. The plant may also be grown in ordinary pits roofed over or under cold frames or disused hotbeds—the sashes being kept covered with straw to exclude the light.

In preparing mushroom beds, whether for indoor or outdoor beds, horse droppings must be obtained, though one-fourth the manure may be from cows. The fresh manure should be mixed with one-third its bulk of clean garden or pasture loam soil The mixture is then firmly beaten down with a spade and allowed to stand under cover for a week unless in the meantime it ferments too violently, in which case the pile must be turned over and made afresh , adding a little fresh soil to the pile. In making the beds, firm the mixture of soil and manure by treading on it with the feet or beating with a brick. Make the bed when firmed 8 inches thick. Let bed stand for a few days, then insert a thermometer into a hole made for spawning. The spawn of the cultivated mushroom is sold in bricks by all the larger seedsmen. Another variety is sold in flakes, but the brick spawn seems to be the best. Each brick is broken into a dozen or eighteen pieces. Make holes in the bed about ten inches apart each way and insert the pieces of brick-spawn so that they will be covered two inches deep. Beat the covering as firm as rest of bed. Let the spawned bed stand for 6 to 8 days and then cover the whole with two inches of clean garden soil. This soil covering must not be put on until at least six days after spawning.

Prisoner: Your honor, I used to give your daughter singing lessons.

Judge: Twenty years.

The Ornamental Garden

By ERNEST BRAUNTON

Planting School Grounds

COMFORT IS NOT the only reason for planting about the schoolhouse. The trees have also an educational value. Indeed, bare grounds may be regarded as an opportunity. Children interested in the work of selecting, planting, and growing trees and shrubs about the school can gain in the work on little knowledge of right principles and methods. Many people think that to plant a tree all that needs to be done is to dig up a sapling, or buy it, and set it in a hole. This is a great mistake, responsible for many unnecessary failures. Some knowledge of tree culture is a thing sure to prove useful to a large proportion of school children.

Forestry is beginning to attract attention as a possible subject of school instruction. So far the interest in it is mainly as a branch of nature study, but its growing economic importance may eventually result in its extensive introduction into courses of study. Technical forestry can not be taught in the schools as part of a general education, and it ought not to be supposed that tree planting on school grounds looks in that direction. Nevertheless a plantation of forest trees or a wood lot, in connection with a school, would give an excellent opportunity for study of forest growth and management, and in many places it is perfectly feasible.

But there is another side to the educational value of tree planting, which is of first importance. It is money well spent to make the schoolhouse and everything about it attractive and beautiful. Here is one of the centers of life of the community, the one in which is gathered its most impressionable element. The school is supported by public expense in order to make good American citizens. It aims at securing the highest development of mind and character. Keep this thought in mind and see that the drudgery inside is lightened by the natural beauty without, for in our State we may garden all the year.

ROSE TYPES.

The Hybrid Noisettes.

These roses are always in bloom, and are very valuable; should be in every collection, where they are sure to give satisfaction.

The Mosses.

The Moss Rose originated in Switzerland. Sepals are covered with moss-like glands; unsurpassed as buds. Should be heavily pruned in winter.

The Hybrid Teas.

The roses in this group are much stronger growers than the full Teas, and combine free flowering qualities with the rich coloring of the Hybrid Perpetuals.

The Polyanthas.

This is a group from Japan. They are ever-blooming, flowers are small but exquisitely formed, and are borne on slender stems in panicled clusters. Growing low and compact, they are very desirable for edging.

The Bengals or Chinas.

Natives of China. Of moderate growth and very fragrant. The foliage and flowers are small. They are valuable for borders on account of their compact growth and the profusion of br liant crimson buds they produce.

The Bourbons.

The varieties of this class differ greatly in their general characteristics; those of moderate growth require close pruning. They are constant bloomers; the flowers are generally of light shade; the foliage is leathery, rich and luxuriant; and they are at their best in the Autumn.

Tea or Ever-Blooming.

This is one of the most important groups or roses and on account of their rance, combined with their delicate tints, and fine form, are deservedly popular. They require more care and attention than any of the other classes and should not be pruned too closely.

The Noisettes or Champneys.

This class of roses is of American origin. The group is of vigorous growth and the flowers have a tendency to grow in clusters. With a few exceptions all the varieties are vigorous climbers, and their rich bright green foliage, combined with the delicately tinted flowers, renders them most attractive for this purpose.

The Prairies.

This is a very distinct class, remarkable for its hardiness. The leaves are large, rather rough, and of a rich dark green. They grow very rapidly, exceeding in this respect any other variety, and are excellent for covering walls, and old buildings; bloom in large clusters after all common roses are gone, and present a very striking appearance.

The Hybrid Perpetuals.

These constitute a very striking and distinct family of roses, easily distinguished from all others by their luxuriant foliage, prodigious blooms and vigor of growth. They are perfectly hardy and of very robust habit, thriving with little care or attention. The more vigorous growers require close pruning. Although styled perpetual bloomers, they are not so in reality, blooming only in the spring and fall. As a class they are deservedly popular, varying in color from snowiest-white to the deepest crimson.

PRESERVING HOLLOW TREES.

Often a valuable park or roadside tree is found to be hollow and decaying rapidly, and unless something is done to preserve it, it will not last long. We have seen trees preserved as follows: Remove all unsound and decaying wood with a chisel until the sound wood is exposed. Mix one part Portland cement and three parts clean, sharp sand into a thin mortar and fill the cavity with it. When it is about "set" coat the exposed surface with a mortar of about one part cement and one part sand. It is recommended to treat the exposed wood, inside the cavity, with a solution of one pound copper sulphate in five gallons of water before putting in the cement. In cases of cavities being too large to fill by reason of the expense, the trees may be plastered inside with the above mixture.

First Politician—You remember that famous saying of Lincoln's "You can fool all the people some of the time, some of the people some of the time, but you can't fool all the people all the time."

Second Politician—Well, I'm no hog. Some of the people for mine.

FARMS WANTED.

A real estate dealer remarked, the other other day, that he can notice a demand growing for country places—small farms. And he says, the increasing tendency of city dwellers to buy homes in the country, is not confined, as is generally believed, to the very rich. Those of moderate means are also gravitating toward the green fields. For a number of years it has been the fashion of the rich to spend the greater part of the year in the country, and to occupy the town house but a few weeks at most. On the Pacific Coast this desire has run to beach localities. Now there is a disposition to make permanent homes in the country, and this desire is not confined wholly to the millionaires. Men with modest incomes are buying homes as far removed from the dust, noise and smoke of the cities as their business will allow. While this exodus to the country benefits directly only farm properties contiguous to the cities, the final effect is to raise the value of such property over a wide extent of territory. If what President Hill, the great railway magnate, says is true, namely, that within the next fifty years most of the now flourishing industries will have become silent because of the exhaustion of the mines and forests and wells upon which they depend, and that the population will then be compelled to turn to the tillage of the soil, the appreciation in the value of farm lands will be enormous. In any event it is the part of wisdom to stick to the farm. It will feed and clothe one and keep a roof over his head whatever happens.

HORTICULTURAL COMMISSIONERS.

If the law now on the statute books of California creating and maintaining County Horticultural Commissioners is to stand for anything, it must be construed with the force it was intended to carry when it was enacted.

Politics should have no bearing whatever on the appointment of individuals to compose the commission, men should be selected by the boards of supervisors with only one thought in mind; competency and executive ability.

The expense of maintaining the county horticultural commission is a very considerable item for the public to bear, and in return the public is entitled to receive adequate return. It is quite often the case that a change in boards of supervisors leads to changes in the appointment of horticultural commissioners, and it is too frequently the case that these changes, are not for the interest of the public. There may be instances, of course, where a change of commissioners is necessary; where more competent members are needed, and in such cases the people gain by the reorganization. But where the old members are satisfactory it is best to let well enough alone. It takes some time to learn the conditions of a county and new members must gain the knowledge before they can be useful to horticulturists. In the meantime the orchards are suffering and the county is paying the new commissioners for the knowledge they are acquiring. Hence the old saying, "Let well-enough alone," applies with peculiar emphasis to horticultural commissioners who are satisfactory in every other sense possibly except their political affiliations.

What the public wants is efficiency in the commissioner not personal political convictions.

THE PUMPKIN PIE.

While Thanksgiving is the anniversary when this New England dainty shines at table the brightest and occupies the chiefest place on the culinary baord, yet on almost every other important festival occasion it holds a place undisputed and unchallenged.

The New York Independent undertakes to tell us a secret about the pumpkin pie. Why it isn't the same today as it was when mother used to make it. The secret told by the writer is as follows:

"I think I may be able to help you to a real pumpkin pie, such as our mothers knew how to make. The pie was evolved out of the patient continuance in well-doing of the housemother. The secret lies not in"pinches"of this or that good thing, but in the right preparation of the pumpkin before it is ready to be made into pies. It lies in the stewing of the pumpkin.

Cut the pumpkin into cubes an inch square. Place in a large kettle with plenty of water. Let it boil from eight in the morning until four or five in the afternoon, adding more water if needed. Then with an old-time pudding stick begin to stir it. Keep on stirring every few minutes until your pumpkin is reduced to a rich brown, dry sauce.

The process of stewing it down requires hours.

The little mother sat in her rocker with her knitting, and did not let the pumpkin burn. Or she flitted about the kitchen attending to other duties, but not once did she forget the pumpkin When every drop of water was dried out her watch was over. Of this dry, brown sauce, one cupful is enough for a pie. Put an egg in your pie if you like. It is not necessary. Good milk, sugar, of you wish it, sweeter than the punmpkin itself, and spice to your taste, and you will not be obliged to eat over in memory that portion of your New Year's dinner."

Ah,. there is the trouble; what housekeeper in these strenuous days has time to watch her pumpkin stew nine hours?. We fear the art has passed away.

FRUIT GROWERS MISUNDERSTOOD..

Not only in this State, but in adjoining States, a misapprehension appears to exist regarding the resolution adopted by the Fruit Growers Convention at Hanford, a short time ago, regarding Chinese labor in California.

To know exactly what action the convention did take it will be well to recite the resolution passed by that body.

It is as follows:

Whereas, Farm labor is becoming increasingly difficult to obtain, and in California especially the great fruit and wine industries are threatened with disaster unless some remedy be found to get more labor; therefore, be it

Resolved, That the fruit Growers of California, in convention assembled, favor such modification of the Chinese exclusion act as will permit the enactment of laws making possible restricted immigration of laborers irrespective of nationality.

This resolution was passed after due deliberation, with all the facts set forth clearly and impartially, and stands as the deliberate conviction of the members, who were brought to endorse it because of the conditions under which they are forced to work at the present time.

We do not, for a moment entertain the thought that the resolution is the expression of the desire of the undividual members of the convention. The truth is they are forced to it because of inability to secure and retain American or English labor.

In the development of our Western Empire we must have the benefit of skilled labor if we can get it, but if we can not we must have less intelligent labor. The Chinese has shown himself to be more tractable than the Japanese, whose personal interest, at all times, dominates his loyalty to his employer. The Chinese, therefore is the better suited to California conditions, and as we can not procure Caucasian labor, and Japanese help is not dependable, what must we do for laborers in California, except to take the Chinese.

The farmers of this State can not permit their crops to go to waste to gratify the sentiment of political agitators. They have too much at stake, so has the State, whose resourses would be crippled immeasurably were the products of the soil to be allowed to rot in the field.

Prof. Wickson explains the situation tersely, it seems to us, in this declaration. "Sincerely as our growers prefer loyal and efficient service by those of Causasian blood, it is incontestable that such labor is not to be had in adequate quantity and at a price which the present margin of profit in fruit operations can allow."

This is the undisguised situation. We are facing a serious problem and the sooner we accept the logic of the facts the better it will be for the future interests of the fruit growers of California.

GARFIELD'S DISCOVERY.

Commissioner of Corporations, Garfield, tells the country that it is in the grip of railroads. This assertion he bases on an examination he made of the effect of water transportation on railroad rates.

The suggestion that such an investigation should be made was advanced in a resolution offered last spring in the House of Representatives but no action on the measure was taken, the railroad interests being strong enough to prevent its consideration.

The commissioner of corporations decided, however, that the matter was one of sufficient importance to engage the attention of his experts and for several weeks past there has been quietly under way an inquiry into the relations of railroads with canals and steamship and canal boat lines.

The facts unearthed demonstrate, so Mr. Garfield claims, that the railroads have their hands upon the water transportation, both inland and coastwise, and that a working arrangement even exists with ocean steamship companies. The ability of railroads to maintain non-competitive rates and to disciminate between different sections of the country thus becomes apparent.

News of Country Life in the Golden West

Southern California

HORTICULTURE.

The Bloomington olive oil mill is on a thirteen-hour a day shift. The company is securing a big supply of olives, which will insure a good season's run.

Oranges are moving quite rapidly from Bloomington, some growers cleaning up their trees at the first picking. The fruit is in excellent condition, and is demanding a good price.

All of the Rialto packing houses have a crew busy. The fruit brought in is of a very superior grade, of fine color and flavor, and shows no effect whatever of the recent low temperature.

It is reported by Col. W. M. Slosson, supervisor of the Santa Barbara forest reserve, that very satisfactory progress has been made in the preliminary work of establishing the auxilliary tree planting stations that have been undertaken.

An authority at Santa Ana says in regard to hard and soft shell walnuts, that the output of hard shells is growing less and less each year. All orchards now being planted are of the soft shell variety, and the old hard shell trees are either dying off or being grubbed out.

There seems to be a tendency among the Corona fruit men to retard the movement of oranges until the fruit is well colored. It is anticipated that shipments will be light until the middle of January. Seventeen cars of oranges have been sent out since December 1, and sixteen cars of lemons.

The California Vegetable union has closed a contract to handle the output of the Olive Cabbage Grower's association the coming season. Its acreage aggregates over 250. The prices will be fixed from week to week, the same as the past season. The acreage of Fullerton, Placentia, Olive, La Habra and Orangethorpe is large.

The Gowen & Willard packing company of Santa Ana, has taken up the line of extracting and shipping walnut meats and will make this a specialty hereafter. This company has at present about sixty people engaged in cracking nuts and taking out the meats. The coast affords a fine market for this line and the demand is good.

AGRICULTURE.

Three hundred acres of cabbages will be turned into sauer kraut at the Huntington Beach cannery.

From 400 to 500 acres of tomatoes will be planted the coming season just to supply the big cannery at Huntington Beach.

Another rain has given the ground a good soaking, adding about 2.13 inches during the storm of the past week, and bringing the total for the season up to 6.30 inches, reports the Perris Progress.

The express shipments for the week from the Escondido office of the Wells Fargo Express Co. were 1890 dozen of eggs, 5221 pounds of poultry and 830 pounds of cream.

The season's rainfall to January 1st in San Bernardino totaled 8.83 inches, or almost double the average rainfall to January 1 for the past 36 years, and two and one-half times last year's record at this time.

G. W. Belden returned from Modesto last Monday with 27 head of fancy milch strain Holstein cows and one bull, for which he paid from $150 to $350 each. Some of the cows have records of from 17 to 24 pounds of butter per week.—Holtville Tribune.

The precipitation at Highland for the storm ending at 10 o'clock Jan. 1st, was .68 of an inch, the record for the season being 10.29. This is the first instance in ten years where the season's rain record has reached 10 inches in December.

On Monday last Jas. Allen shipped a carload of Christmas hogs to the Cudahy Packing Co. of Los Angeles. The whole drove averaged 420 pounds apiece. One fine fellow that was raised by Jim Brown at Oceano came to $26.25.—Arroyo Grande Herald.

The rain storm which began in Redlands Thursday morning, seemed over last night at midnight, only a few light clouds remaining in the skies at that time, and the moon and stars generally shining. The total rainfall after midnight Thursday night was 95 hundredths of an inch, making 2.97 inches for the storm of three days. This makes the season's rainfall 13.32 inches, the largest at this time of the year since 1889-90.

Professor Shaw Endorses Stock Food.

Professor Thomas Shaw has this to say in reference to Stock Foods. "They will always be found useful when properly made. The time will never come when intelligent feeders will cease to use them. The necessity for using them and the advantage therefrom will become greater as foods become increasingly dear. Whether it will be profitable to feed them will depend upon the necessity for using them and on their cost. My special desire, however, is to show that they have a place in the economy of intelligent feeding. The question of price must be fought out between buyer and seller."

With this indorsement from one of the foremost authorities on feeding in the country, it would seem that the value of feeding tonics, etc., is unquestionable; therefore, the only problem is at what price such foods cease to become profitable.

In Bulletin No. 106 issued by the Hatch Experimental Station they recommend the use of certain medicinal tonics to be given in one tablespoonful doses one a day for 10 days, then omit for three days, then give 10 days more. They estimate the cost of the tonics they recommend at 20 cents per pound.

Dr. Hess Stock Food, formulated by Dr. Hess, a regular graduate of medicine and also veterinary surgery, contains the best tonics known to science, together with the salts of iron which are the greatest known blood and tissue builders, the nitrates of sodium and potassium which assist in eliminating the poisonous waste material from the system, and laxatives which regulate the bowels.

This preparation is manufactured by Dr. Hess & Clark, Ashland, Ohio, and is sold on a written guarantee at five cents per pound in 100 pound sacks, smaller quantities at a slight advance. At this price can anyone question the economy of feeding such a compound? It costs less than a penny a day to feed this preparation to a horse, cow or steer, and but three cents per month for the average hog. Consider how little additional increase in weight or milk is necessary to cover the cost of this preparation.

J. F. Dotzman, Clinton Stock Farm, Centralia, Ill., says: "I am feeding Dr. Hess Stock Food to my horses, three stallions, (Hal-Gordon) pacer, brother to Star Pointer; George Geisler, trotter, out of the best blood lineage in existence; Andrew Jackson, trotting bred coach horse, son of George Geisler, above. All three stallions in public service, stud. Also work horses.

"I bought Dr. Hess Stock Food at Berger's Drug Store at Carlyle. I had never used any stock food before, but reading in Coleman's Rural World of Dr. Hess' professional knowledge, I purchased a sack of Dr. Hess Stock Food and fed it to five horses, and am almost surprised at its good results. Will keep it always on hand.

A Studebaker Almanac Free.

The Studebaker Almanac for 1907 is in many ways a decided advance over the previous issues of this popular book.

In addition to the usual astronomical tables, etc., it is crowded full of valuable data and information for the farmer.

The cover, printed in colors, is from a handsome drawing by Edward Penfield, a well-known artist.

Our readers can obtain it free for a 2-cent stamp to cover postage, by addressing the Studebaker Bros. Mfg. Co., South Bend, Ind., and mentioning this paper. Do not fail to send for it.

Oysters in Cucumber Cases.

Cut the top slice off each cucumber, scoop out the inside, leaving a thick shell, and heat in oven.

Cream the oysters, making the sauce thick and rich, fill the cases, return to oven, heat well and serve hot.

Northern California

HORTICULTURE.

The total orange and lemon shipments from the Porterville, Lindsay and Exeter districts up to December 29th were: Oranges 1408 carloads, lemons 76 cars.

The reports show that Lindsay shipped 313 cars more than Porterville and 382 cars more than Exeter, and within 60 cars of the total shipments of both Exeter and Porterville.

Lindsay now has about 5000 acres planted to oranges and less than half in bearing and probably not over one-third in full bearing, so it will be seen that the increase of shipments from this point during the next five years at least will be very large.

An expert on orange-growing in the central part of this state, has examined the soil in the vicinity of Biggs in Butte county very carefully and pronounces it far better for citrus fruits than a large portion of the land already profitably devoted to that industry.

The highest gross received for a carload of grapes from Florin of 1000 crates was $1881. This car netted the growers $1262.20, and was the first car of the season, while the lowest return to the growers was for a car shipped four days later in the same market.

Contrary to expectations the orange shipping from Fair Oaks continues with little abatement. The severe wind storm made it necessary to gather the crop and ship as soon as possible. Mr. Oakes has his packing-house busy handling oranges and olives.

The San Bernardino Sun says: The Rialto Citrus Union expects to get out seven or eight carloads of oranges at this time. The Exchange, or Orange-Lemon Association, will probably put a few lemons put in for good measure. The C. C. U. is working on oranges out about six carloads. The Rialto Orange Company has planned to get out five or six cars of oranges with and will put out two cars tomorrow. The Speich, Morgan company put out a car of lemons yesterday.

Prof. M. B. Waite, who has charge of the work being done in the Sacramento valley, to rid the orchardists of the destructive pear blight, states that the campaign is progressing in Sacramento county in a manner eminently satisfactory, and despite the fact that many orchards will be wiped out of the valley, is not entirely rid of the pest it will be the fault of the growers who have from the initiation of the work last winter consistently opposed the plans of the bureau.

With the closing of the year there will be no dried fruit in the hands of the growers of Anderson section. It all having been sold and delivered to the packers; also the packers will close the packing season with empty houses. There is only about 200 tons now left of the prune crop in both the Sanitary and C. F. C. A. packing-houses at this place, and this will be packed and shipped within the next fifteen days, which will wind up a very prosperous and lively fruit year for this section.

AGRICULTURE.

A Sacramento dealer in discussing the situation said:

There are nearly 5000 bales of hops yet unsold in Mendocino county and the growers are holding out for 15 cents.

The wind-up of 1906 shipments of oranges from the Lindsay District shows an increase over the previous year of 160 cars, and places the total at 755 cars.

Almost seven feet of rain for the 1906! Such is the record of rainfall at Nevada City. The heavest annual fall of rain was in 1867, when 102.85 inches were recorded; and the next heavest was 85.47 in 1884, and now 1906, follows with 82.72 inches.

A correspondant at Biggs writes:—"The easy life heretofore enjoyed by the wheat-grower, and the immense tracts of lands controlled by him and necessary to his mode of agriculture has retarded the developement of this county until some of its most important assets have been lost sight of almost entirely."

"Without question there is a much less quantity of potatoes at present than is usual at this season of the year, and with a car shortage prevailing all over the country and a greatly increased consumptive demand, it would seem as if a strong advance in the price of potatoes was likely to occur before new potatoes are in sufficient supply to be a factor in regulating prices."

The apple shipping season in Pajaro valley has virtually closed, as there will probably not be more than eight or ten more carloads to go forward, therefore a few figures regarding the crop wil no doubt pdove of interest at this time. About 2000 carloads of apples have been shipped in the green state for the season to date from Watsonville, Pajaro, Vega and Aromas, as against approximately 3000 carloads lost season.

John H. Tull, the agent of the bureau of foreign seed and plant introduction, has arrived at Chico, direct from Japan, where he was engaged in securing roots of the Japanese matting rushes for experimentai purposes throughout the United States. He will be followed in few days with a shipment of 150 cases or one carload of roots obtained under the most vigorous opposition of the Japanese of the Japanese producers and the local government.

The James Feeley company of Red Bluff, closed its packing-house Saturday afternoon after a run which was practically continuous from September 1st, nearly four months, and most of that time the works were in operation both day and night. Between three and four hundred tons more of dried fruits were packed than last year and the employes had nearly two months more work. These figures read very smoothly, but they represent a force of 42 people all the while and this number includes from 15 to 25 girls. The weekly payroll ranged from $400 to $500 and frequently while buying fruit the expenditures have amounted to $20,000 in a single day.

SOME GOOD POINTERS.

"He who dreameth may be a genius, but he who doeth is a hero."

"Who would convince must feel and who would feel must believe."

"If you can't get along with people, keep away from them."

"Because a man doesn't call you a liar, he doesn't believe all you are telling him."

"A man may be judged by the companies he promotes.' '

"Love is the only thing that was old when time was a baby."

"The heart is too often far from the hand in a formal greeting.' '

"Many a mushroom promise is a toadstool of fulfilment."

"The life of an insurance agent," siged Premyums, "is full of wormwood and gall."

"I hadn't' noticed the wormwood," growled the victim.

"HIS METHOD WAS PECULIAR."

Many "fool" articles occasionally get into the daily press about the wonders of plant life, but the following regarding the origin of a new melon, from a recent number of the "The Times" of Los Angeles, surely caps the climax:

"His method was pecular. He took a selected pineapple melon vine, and covered its blossoms with the pollen from the eastern pomgranate and the Muscat grape. For three years he carried on the experimental work, but finally tired of the task and for five years the little handful of seed that he had saved lay wrapped up in a parcel in his home."

"Last year he had the satisfaction of securing fifteen tons of the delicious fruit, and he then felt that the melon was so securely fixed that the growing might be undertaken on a commercial scale."

BUYS THE WORLD'S FAMOUS EGG FOOD NO. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER

Used by all the largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the GOLD MEDAL at the St. Louis World's Fair for greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th. 1904.—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A FILCHER, Commissioner.

And Now Comes New Reward for Merit:

Read the following telegram received from the Lewis & Clark Exposition at Portland

"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Profit in the Poultry Yard

By Mrs. A. Basley, Hollywood, Cal.

People Who Do

"I DIVIDE people into two classes" said my friend Mrs. Sherman when we were discussing success and failure last week. "People who do, and people who do not do!"

It is true there are people who go ahead and do a thing without waiting. There are people who are doing something all the time, people who enjoy work, those are the successful people, those are the people that will succeed in raising poultry; fine poultry, and those are really the only people who do succeed in the poultry industry.

The people who "do" and who know how are the ones who succeed in every business, and more especially with fowls. My desk has for many years been a sort of clearinghouse for those in difficulty with their chickens, and many a puzzling letter has been studied over, while occasionally a sick or dead fowl has been brought in for me to inspect. I never like to have sick fowls carried about the country, for fear of disseminating disease, but I remember one old man, who had worked for me, coming in with a dead hen, she had acted as if paralyzed and he thought she might have been poisoned by squirrel poison, set out by his neighbors.

We opened her, found the liver greatly enlarged and disintegrated, small tumors in the ovaries, and the abdominal cavity was full of a bad smelling fluid.

"How old is the hen?" I asked.

"I really do not know," he replied, "you see the hens have been on the farm so long and are all alike, so I do not know one from another."

"Well, I will tell you, I think this hen is very old; may be ten years old or more, and she has died of old age as much as anything.

I then showed him that she had spurs growing on her legs like an old male bird; he had noticed these, but when I asked if he had heard a sound like a young cockerel crowing, or trying to crow in the morning, he replied he had.

"It was your old hen," said I, "she was so old she had stopped laying; probably had not layed for four or five years, and had begun to assume the characteristics of a male bird."

"Then you do not think it was strychnine?"

"No! I feel sure it was old age, and not the fault of your neighbors."

I then advised him to use leg bands on his fowls, as by this means he could tell their age. I explained to him that the fowl had cost him four or five years feed at $1 per year. This was a loss of four or five dollars besides the loss of the hen, and if he had marketed her five years ago, he would have been that much ahead.

"What are leg bands, anyway?" he asked. "Leg bands are small metal bracelets with a number on each one: they are usually made of aluminum, or copper and are quite light and easily put on. By putting one on the right leg of each pullet this year, and on the left leg of each hatched next year, you can tell at a glance which are the one and two year old hens. If you want to keep your hens for the third and fourth year, you can put other kinds of leg bands on, using aluminum for two years, and then copper for two years. Or you can use different styles and shapes of bands."

Another way of marking is by using a small punch, making a small hole in the web of one foot as soon as the chick is hatched. This only takes a minute, and if clearly punched out, the mark stays for life. I always mark the different pens a different way, so that I know for sure the pedigree of each chick. For instance, all the daughters of "Snow Queen," my prize White Rock that layed 225 eggs in nine months, had a hole punched in the outside web of the right foot; her grand-children in the inside web of the same foot, and the following year the great grand-children in both webs of the right foot, besides this, they all had leg bands when old enough. I have also frequently marked the young by sewing on their legs a piece of woolen braid scarlet for one brood, blue for another, this was merely temporary, until they matured, or were large enough to wear the metal bands.

Then again, by having the leg bands numbered, and by penciling the number on the egg which each hen laid. I could keep track of the number of eggs laid by each; the number of chicks hatched from each, and in time, as each chick developed and was banded, I had a complete "family tree."

It was interesting work and I tried to explain it to my old man who thought his hen had been poisoned.

"Lots o' trouble to take for hens!" was his comment. He was not one of the people "who do things."

When this goes to print the Poultry show of the Poultry Breeders of Southern California will be over. It was surely a good show both as regards numbers and quality. Eastern breeders and even judges from the East expressed to me their surprise at the very superior quality of the birds. "They could not be surpassed," said one in Chicago or in New York. "It only shows" said another, "how foolish it is for breeders here to send away for stock when they could do better by buying at home."

"That is what I have always said," I replied. It is most unwise to send away for fowls and run the risk of bringing sickness into the flock, as change of climate from the East to California often develops disease, when we have right here in our midst fowls superior to any in the country. I am not prejudiced, for an Eastern judge assured me that the Columbian Wyandotte hen winning the first prize, was better than any he had seen in Chicago or any other large show where he had judged. A list of our advertisers who are winners will be given and those who wish to improve their fowls; and we nearly all of us can improve our flocks, should get from them a cockerel or a hen or a setting of eggs and be prepared to win next year. This is just the right time to prepare to get early layers for next fall and winter.

We know a man so cross-eyed that he put his hand into another man's pocket and abducted therefrom a watch. He said he wanted to learn the time. The judge told him it would be three years.

Make the hens scratch in clean litter for every kernel they get. They need the exercise, they will not eat so fast and stuff full, then go and loaf.

The "Chatham" Incubators and Brooders

POULTRY EXHIBITIONS THIS FALL.

Those who have so far been successful this winter, in exhibiting their poultry and winning the prizes which have been awarded in the California shows are those who, have learned by former experience thoroughly to condition and care for their poultry, so as to bring them in tothe exhibition hall in the best of condition. To those not acquainted with the meaning of "conditioning" poultry for winter exhibitions, we would say that they are groomed for the occasion the same as are horses or cattle for the show room.

We suppose it did not escape the notice of the new beginner even, that one of the most important features of success in the exhibiting of poultry is to have thoroughly well-groomed specimens that are strong and vigorous in constitution and able to stand the strain of the preparation for the show pen, as well as the excitement of the exhibition hall when there. The feathers of exhibition specimens must be absolutely clean, and perfect in formation as well. There plumage must besuch as can only be obtained through perfect health and perfect preparation.

The birds shown through California this fall have been remarkably well-groomed, as a general thing, which added interest to their presentation.

Solution of Exhibitions.

It was apparent all through the successive shows, from first to last, that the utmost pains has been given the selection of the birds to be exhibited.

Fowls for exhibition were selected from among the owner's flocks on account of elegance of finish, form and plumage. These fowls were kept from the sun for several weeks prior to the exhibition. They were fed those foods most likely to give them good constitutional vigor and impart a gloss and finish to the plumage. When brought to this condition of perfection, they were thoroughly washed in tubs of water, so that their entire plumage, shanks, feet and head as well, were clean and free from dirt. This is an absolute necessity in the showing of white fowls of any kind. Great benefit can be imparted to the dark or black-colored poultry as well. Those who have never seen a fowl washed for exhibition would scarcely understand the amount of dirt that accumulates on poultry. A tub of clean warm water is scarcely fit to wash more than three or four fowls before it must be changed. In washing the fowls, three tubs of water must be provided—one of quite warm water, about the same as would be made use of for the washing of clothes, the second lukewarm water, the third cold water.

The fowl is first placed in the warm water, and some good kind of soap, usually ivory soap, thoroughly rubbed into the feather plumage with the hands and fingers down to the skin. After being washed in this way, the feet and shanks are thoroughly scrubbed with a stiff brush, and as much of the soap and dirt as possible rinsed from the plumage. Then they are removed and thoroughly rinsed, so as to remove all the soap, in the second tub of luke-warm water. When cleansed in this way, they are passed to the tub of cold water to finish the rinsing and lessen the possibility of their taking colds. When removed from this, they are wiped as dry as possible

WHITE MINORCAS

We have taken the greatest care in the selection of our breeding stock, as well as importing fresh blood from the best Eastern strains. Price on eggs from selected stock, $2.50 per setting of 15, $4.50 two settings. Incubator lots $10.00 per 100. A few cockerels and pullets for sale, to make room. Prices on application.

with towels and cloths, always rubbing the plumage the right way to remove the moisture. Then they are placed in coops in a very warm room or near the fire, where they will dry as quickly as possible.

Fowls that are thus washed, if well done, soon fluff out, and the plumage has a much more pleasing appearance than before. All kinds and colors of poultry are washed in this way for exhibition. When one becomes expert in the washing of plumage, it is but a small task to prepare 25 to 30 from four o'clock in the afternoon to a late bed-time. Those who cannot give their time to the cleansing of poultry during the daytime hours are often found at from six o'clock to midnight preparing their poultry in the hope of having them in a condition that will win for them the coveted prizes.

Where the entire fowl is not cleansed in this way, the legs and shanks at least must be thoroughly washed and cleaned with soap and a brush. Remove every possible piece of dirt in and about the shanks and along the scales. This adds considerable attractiveness to the shanks themselves. When thoroughly washed or cleansed, they can be polished with a woolen rag or chamois and made to look very smooth and attractive in the exhibition pen. The cleaning of the face, comb and wattles had better be done with a soft sponge and lukewarm water. Many use a mixture of alcohol and water, while others use oil. Either of these is apt to cause a scale to form upon the comb and wattles and rub off, much as dandruff will work off the head. Nothing makes the face, comb the wattles more attractive than the use of water and sponge. In this way they can be thoroughly cleansed, and dried with a soft cloth, without the danger of scale forming.

Poultry for exhibition should be fed nothing but solid, substantial grain food, such as wheat, hulled oats and a little corn. The fowl that has been conditioned on mash food will not stand the strain of the exhibition room as well as those that have been properly fed on a grain ration.

When poultry has been returned from the exhibition hall, every care and attention should be given them. Keep them from being exposed to inclement weather, for at this time they are quite apt to take cold if so exposed. An English fashion, which is a very good on,e is to feed the poultry that comes from the exhibition on some stale bread soaked in ale or beer. A little of this acts as a stimulant on the poultry and often wards off the danger of cold or of the change from the relaxation of the heated exhibition hall to the cold of poultry houses.

To be successful in the large exhibitions of the country means the giving of every care and attention to the conditioning and preparing of the fowls for the show. It is scarcely possible at the present time to win prizes at the poultry exhibitions, unless the poultry shown has been put in the best condition for the occasion. Perhaps no other feature of the scale of points has so much influence for and against the specimen as has condition. A bird that is otherwise in perfect condition, might be able to win prizes from a much better specimen that was in poor condition. Perfect condition covers many evils, and often the successful exhibitor can lay much of his success to the fact that he was able to put his birds in the finest show condition.

Bountiful Orange Crops

Every soil has so much growing power per acre, just as a boiler has so much horse-power per square foot. To keep this growing-power up to the maximum, you must keep the soil supplied with the necessary fertilizing elements, just as you must keep the boiler supplied with fuel and water. Therefore, use

POTASH

A maximum yield of oranges is impossible without a good supply of Potash in the soil. A complete fertilizer containing at least 10 per cent. of Potash should be used.

We want to send you our free booklet, **"Orange Culture."** Write for it if interested in growing oranges.

The Best and Cheapest

For Orchard, Garden or Field it has no equal. A trial will convince you of its merits. Send for my circular of testimonials.

Tom Lewis brought to this office an orange weighing two (2) pounds, grown by W. J. Wilson, a prominent orange grower and vineyardist of Newcastle, Placer County, who has used Tom Lewis' Fertilizer for four seasons and swears by it.—FROM SACRAMENTO EVENING STAR, DECEMBER 23, 1904.

Office and Works, 1916 and 1918 10th St., Sacramento, Cal.

Mandarin Orange History

Continued from Page 29.

Reasoner Bros., by Bonavia said to be a suntara orange, I must say that any attempt to decide this question places one on exceedinly debatable ground.

In 1805 two varieties of mandarin oranges were introduced into England from Canton by Sir Abraham Hume and fruit produced from these trees was illustrated in 1817 and 1824. According to du Breuil, the mandarin orange was introduced into Europe (continental) about 1828. In the vicinity of Parma it was cultivated on a large scale as early as 1842 and its culture in the county of Niza and the region surrounding Genoa dates back to 1848 or 1850.

The conclusions reached by du Breuil are further sustantiated by the fact that Gallesio appears not to have known this tree and Risso and Poiteau make a mention of it in the first edition of their work. Du Breuil states that in commerce a distinction was made, betweent the mandarins of Parma and those of Spain, Algeria, Niza and the coast of Italy.

Bonavia says that the mandarin orange was probably introduced into India from Egypt with a collection of orange trees in 1847, and that a second introduction was made by himself in 1863. It is not improbable t hat the mandarin oranges found their way into Egypt from some one of the countries of southern Europe.

CITRUS INSTITUTE.

A special Citrus Fruit Growers' Institute will be held at Riverside, on the 22-23-24 of January, under the auspices of the State University; J. B. Neff, manager. The conception of the meeting arose in this way: The grounds solicited for the Citrus Experiment Station, located at Riverside, are now being prepared for commencing work in the spring. It was suggested that a conference of practical growers, where the needs for the institution could be brought out, with suggestions from their standpoint as to what investigations may be made most vauable to the industry might materially help in starting the work wisely.

The University management heartily approved and will do what it can for the success of the meeting. President Wheeler, Prof. Wickson, Dean of the Agricultural Department; Prof. Smith, director of the station, and Mr. Mills, local manager, will represent the University; and growers of large experience from various orange sections, whose safe judgment and unselfish interest in the success of the industry, command the confidence of growers generally, will lead the discussions on practical matters needing the attention of the experiment station.

Gov. Pardee, who took much interest in securing the experiment and pathological stations, will be present and address the convention. Indications are that it will be the largest and most significant meeting of citrus fruit growers yet held. J. H. REED
Chairman Local Committee.

Miss Smart: Oh, you may sneer at pet dogs, but they are faithful anyway. I'd rather kiss a pug dog than some men.

Mr. Sneer: Well, well, some men are born lucky.

"I know I'm late, m'dear, but ash true ash I'm here, I wash held up by footpad."

"That was very kind of the footpad, I am sure. You certainly needed some one to hold you up."

I started out to make the best lamp-chimney in the world—I have stuck to it all my life.

My name is on the chimney if it's a MACBETH.

The Index explains how to get a MACBETH chimney to fit every lamp, and how to care for lamps. Sent free to everyone asking for it.

Citrus Fruit Shipments.

LOS ANGELES, Jan. 7.—Oranges, 122 carloads; lemons, 7 carloads. Total to date this season, 2172 of which 424 cars are lemons. Total to same date season, 4277 cars of which 603 cars were lemons.

MUSHROOM SPAWN.

In mushroom growing one of the first requisites is that of securing a fresh, reliable spawn. This material is easily injured be even a short period of storage under improper conditions. In the past, small growers have suffered most, as they frequently purchase any spawn which is on the market.

The process of making mushroom spawn, or of spawn manufacture, as is is commonly termed, has unfortunately received very little attention in this country until recently. Nearly all of the mushroom spawn sold in the American market has been imported. Most of this is grown in England and is put up in the form of bricks or cakes, each brick being about 5½ by 8 1-4 by 1 1-4 inches and weighing from 1 1-8 to 1 1-4 pounds. This brick spawn is frequently spoken of merely as English spawn for the reason that the English article is all put up in this form. The making of brick spawn is not usually practiced by the French growers, who use instead a flake spawn. The explanation of this fact may be that a large number of French growers make their own spawn and the brick method is of course more laborious. The flake spawn consists merely of the loose composted material, equivalent to the ordinary bedding material, through which the mycelium of the fungus has grown abundantly. The brick spawn is very compact and easily handled; and, from the experiments which have been made with the introduction of spawns of various kinds, it would seem to be established that the brick spawn is better fitted to resist the conditions of shipment and subsequent storage. We have, therefore, the curious fact that, although mushroom growing is perfected to the highest degree in France, very little of our imported mushrooms spawn come from that country.

Again, the brick spawn sells at a lowed figure than the flake spawn grown by the French. Good flake spawn is, however, such a dense mass of mycelium that as a rule less is required in spawning.

Apples With Meringue.

Pare and core large, tart apples, place in a pudding pan, fill in the cavities and intervening spaces with sugar—a cupful to six apples—put a lump of butter on top of each apple, add one-third of a cupful of water and bake. Beat the whites of two eggs stiff, add two tablespoonfuls of sugar. Add a spoonful to the top of each apple and brown in the oven.

Queries and Replies

Eucalypts.

Having read the article in issue of December 27 on the different species of Eucalyptus, I feel especially interested in two species, the rudis and rostrata or red gums, as they seem to withstand frosts and do well in alkali soil. In your opinion, would they do well in Los Nietos valley. Last spring I set out 500 blue gums and I think the freezes of this winter have killed nearly of them. If any one can inform me as to where I can get seed of these two varieties, please let me know personally or through the Cultivator, as I would like to put out several acres this spring.—C. R. GREGG, Downey.

The two red gums, E. rostrata and E. tereticornis as well as E. rudis will do very well in your section. Any seed store or nursery advertising with the Cultivator will furnish you with seeds or trees of the above species.

Eucalypt Fence Posts.

Could you inform me what is the best Eucalyptus to grow for fence posts in Riverside county? I have read the articles appearing in the Cultivator with a great deal of interest.—L. L. W., Winchester.

The Sugar Gum, E. corynocalyx, makes the best fence posts unless grown where it may obtain too much water. It is the most drought resistant of all and when grown under arid conditions makes an ideal fence post.

Planting Vineyard.

How far apart is it best to set Zinfandel and Thompson seedless grapes, ten acres of each. If set, say, eight feet each way, should there be an avenue left occasionally? When would you set out rooted vines, now or later? If these don't take up too much room, would thank you very much for an answer through the Cultivator.—D. F. C., Modesto.

The usual distance for planting vine grapes is eight by ten. Thompson seedless vines are usually planted ten by twelve or even wider, as the heavy top growth is staked up and in the way when the spaces are narrow. At every twentieth or twenty-fifth row omit one row for the avenues. The ground should be plowed at once and then let lay idle until March. The weed seeds will germinate and when plowed under the first of March are greatly lessened. Plow the first week in March and harrow the ground fine and smooth, then plant the young vines. Irrigate them in May, and if possible again in late July or first of August. Keep the cultivators going to make a good dust mulch. Use for this purpose a cultivator that has straight teeth that will loosen the soil without turning it over.—M. E. S.

Seed Warts.

I have a five-year-old gelding that has developed a seed wart under his eye. It does not grow, but disfigures the horse. What shall I do with it?—L. B. R., Arbuckle.

We would advise you to consult a veterinarian. If the wart were anywhere except near the eye we would advise leaving it alone. It might go away of its own accord. A strong solution of formaldehyde put on the seed wart will burn it off, but in your case there is danger of burning the eye, so I would suggest that you show the wart to a good veterinarian.

Skin Disease.

What will cure my cow of a skin disease. The hair comes off; the skin gets red and sometimes bleeds.—J. R. S., Santa Clara.

Your cow has blood and skin trouble. Give one tablespoonful of the following, night and morning in feed: Granulated hyposulphite soda, enough to make one pint, mix. Bathe the parts two times daily with following solution: Bicarbonate potash two ounces, carbolic acid one dram, water enough to make one quart, mix.

Warts On Bag.

I should be glad to ask your valuable advice about several points, hoping not to take up too much of your valuable space.

1. My cow gives plenty of good milk, but her bag has had succession of lumps which gather and break, also small warts come on the teats and one teat has a hard lump at the end inside of one. What shall I do?.—A. K. S. Imperial.

If this cow is not very valuable I should dry her off and beef her, the gathering in the udder is not conducive to good wholesome milk, and if the milk was examined under a microscope, it would be apt to show puss and leucocytes. For warts on the teats, use butter of antimony, or castor oil applying it with a small brush after each milking. The hard lump in a teat is difficult to treat, except by cutting and this requires careful work. Now the best thing to do with this cow is to make a careful study and find out if the udder came into this condition from cold, from rough milking or from leaving some milk behind or from irregularity in the time of milking? Learning by failures to do better each time and avoid many of the troubles instead of having to stumble over them.—M. E. S.

Look After This Bull.

I have three cows and two heifers that I cannot get with calf. They have been served about six times and are still coming back. Bull runs with cows but take them up soon as served.

Is it a disease among cows? If so please give remedy, and oblige—Subscriber,—Turlock.

First of all I would take up the bull and feed him some grain, he will be surer. Then it is poor policy to allow him to be running with the cows all the time. When the heifers are discovered to be in heat, they can be treated with the yeast. Take a cupful of the home-made yeast, or take one the common commercial yeast cakes, put it in into a pint and a half of tepid water, keep in a warm place ten hours, then wash out the cow and inject the yeast, after twelve hours serve her and place her in a quiet stall where she will not move around for ten or twelve hours more. We have not failed as yet to catch the misses in the herd with this simple treatment.—M. E. S.

Testing Milk—Stock Melons.

I would like to ask first, which you think is the fairest way of testing milk, by a ten-day composite test or by testing everyday, second, if you know whether stock melons are of any value for butter fat for cows?

The composite test is the simplest way to do it. The fairness of the test consists in always adding exactly the same amount of milk to the composite test, for this purpose after taking a sample from the pail I use a small two dram glass and add that amount of milk to the sample. Stock melons are succulent and increase the milk flow considerably we find. They will help to hold the cows up in their milk. In themselves they are not of great food value, being nearly all water and a little sugar.—M. E. S.

Coughing Pigs.

I have a bunch of young hogs that are coughing. Please advise me what to give.—S. B. B. Calexico.

The probabilities are this cough is due to worms. Turpentine is as good a remedy as I know of for same. Give once daily for three days in succession. Then give the pig one ounce salts, then follow up with half teaspoonful granulated hyposulphite soda once daily.

Worms.

Please tell me what will cure worms in a horse?—C. R. I., Imperial.

Starve horse for twenty-four hours, then give two drams santonin, two ounces turpentine, and one pint raw linseed oil. After giving this dose, then give a sloppy bran mash, six hours later a little hay may be given but feed sparingly until bowels are purged.

Trap Nests.

Having concluded there is very much to be be gained by trap-nesting the hens, I write to ask you of there is any make of trap nests that are operated automaticly?

I examined a trap nest today which had to be set for every hen that went into the box, and worst of all the hen had to be released by hand. Is there not someway to have those nests made so they close the entrance door and open the one for exit when the hen is on the nest. When the hen leaves the nest, the entrance door is raised and the exit closed. It seems to me there ought to be some way to have these nests made so one does not have to look after them so closely.

I should like very much to know your ideas on this, and if there is such a device, where can it be purchased. Now I have an idea again that it might be a better plan to trap each hen separately. That is, one hen in one nest. If an egg is found in nest remove the hen and set the nest again Should the hen leave the nest and no egg was found, put her back in the and give her another chance. How many times do the hens need to pass through these nests. Please answer in the next issue of the Cultivator and oblige. E. B. W. ORANGE.

There is a great deal to be learned by the use of trap nest. The plan of having a nest that will have an exit into another pen has been talked of by several, but I do not know of any yet perfected.

Of course by this plan you could only know the hens that laid that day, you could not tell which hen laid each egg, also I have found hens that would go on a nest, remain there for a time and then come off with out laying any egg. This you could not discover if the hens could release themselves. Consequently it is better to release each hen separately, pencil on her egg her name and the date. This takes less time than you would imagine. I have found that by having one trap nest for every three hens I need only visit the nests twice in the mornings.

Apples For Poultry.

Would you kindly inform me in the Cultivator, whether it would be of any benefit to feed small apples to poultry. I have a lot of small and scabby apples, which I would like to feed them. How many can I feed safely to 100 hens daily? C. B. S. FRUITLAND.

Apples are usually good food for hens, and can be thrown down for them to eat as much as they like. but I do not know about scabby apples.

Would you feed them to a cow?

If the scab is of fungoid growth it might be very bad for hens, but they can usually eat anything that a cow can eat.

Lame Duck.

Can you tell what to do for my Indian Runner duck? He has bumps on the side of his toes that resemble warts, and he is so lame he can hardly walk, after he falls down. He was brought from a farm where there was running water. I have used a trough. Kindly advise me what to do. Mrs. S. S. BALLARD.

Your duck has injured his feet on stoney ground. You had better pare the corns carefully and give him a good bedding of straw. If the feet are you can keep it on by putting a childs sock over will relieve it, and when he gets better I would advise you to kill and eat him, as the corns are almost certain to return.

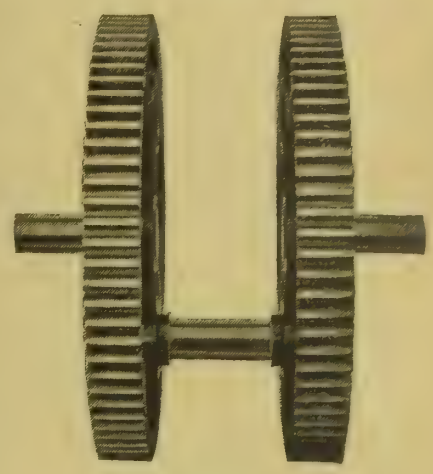
WOOD OF FRUIT TREES.

In the young tree the pith serves a useful purpose, when it holds a considerable amount of moisture, but in older trees it becomes more or less shriveled up, and so far as helping the tree in its growth is concerned, it does nothing.

The heart-wood of the tree is valuable only in strengthening the trunk. There is no life in it; the cells of which it is composed are dead. It contains, besides, a considerable amount of moisture, and when it once starts to decay it rots quite rapidly, resulting in the hollow trunks so frequently to be seen in forest, shade and fruit trees.

In the sap-wood, moisture and food are carried from the soil to the top of the tree and the cells of which the sap-wood is composed are alive and more or less active. When, for any reason, the sap-wood has been killed, it decays very rapidly.

The Pomona Pumps



Are Best For

City Waterworks and Irrigation

BECAUSE—

Using machine cut and slow running gears, they are

PERFECTLY NOISELESS.

They use stepped gearing with no break in the tooth contact, doing away with all rattle and vibration.

BECAUSE—

They have an ideal motion of the pump rods, which consists of a uniform continuous slow up motion, a smooth, quick down movement with absolutely no jerk in starting the rods upward eliminating all rod breakages and valve troubles.

BECAUSE—

They will save you money in cost for power. We use machine cut gearing which alone saves ten per cent. We have a leverage in our gearing which other pump makers do not have and which they do not tell you about when trying to down us.

BECAUSE—

In pumping through long pipe lines, they deliver a continuous steady stream.

They do not hammer out your pipe line by irregular pulsations of the water column.

They save power by keeping the water in continuous motion.

BECAUSE—

They are fitted with improved oiling devices that can be filled without stopping. Pumps may run for weeks continuously.

BECAUSE—

We have advantages in our pumps that investigators appreciate at once, consequently, where one goes others follow and we are fast taking the country.

BECAUSE—

We give a guarantee of satisfaction with every plant.

Send for catalog.

First National Bank

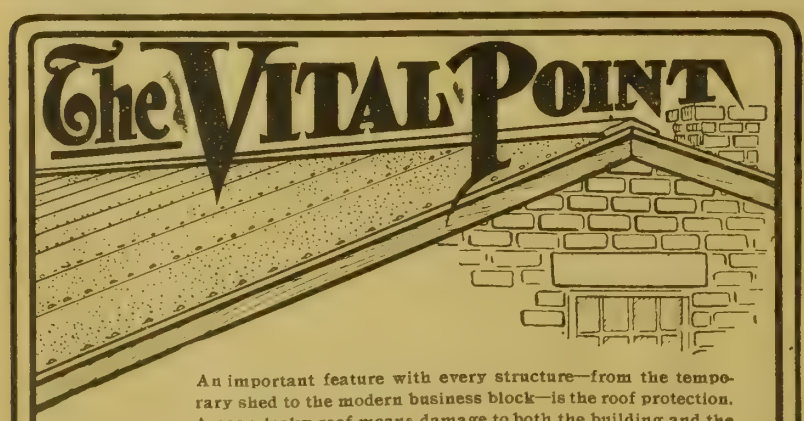
United States Depository for Government Funds

CAPITAL, $1,510,000
TOTAL RESOURCES, $19,400,000

We are prepared to extend to the small depositor the same personal and careful attention that we do to our largest accounts.

ADDITIONAL ASSETS—One Million Five Hundred Thousand Dollars invested in the stock of the Los Angeles Trust Company and the Metropolitan Bank and Trust Co., and held by the officers of the First National Bank, as Trustees, in the interest of the shareholders of that Bank.

The VITAL POINT



An important feature with every structure—from the temporary shed to the modern business block—is the roof protection. A poor, leaky roof means damage to both the building and the goods laced in it. An ideal roof must be absolutely water-proof practically fire-proof and always weather-proof.

Pioneer Rubber Sanded Roofing

Is proof against everything an ideal roof should be proof against. That wear-proof surface of hard flint sand adds years of wear to the roof.

Roofing Book "D" tells all about every class of roofing and building papers—it is sent *free.* Write for it.

Pioneer Roll Paper Co.

219-221 S. Los Angeles St., Los Angeles, Cal.

WITH A SIEVERT OIL BURNER

You can burn 100,000 cubic feet of air with every 130 gallons of oil: this means perfect combustion. To burn more than 100,000 cubic feet of air with 130 gallons of oil, there is a decided loss of heat. To burn less than 100,000 cubic feet of air there is a loss of fuel.
The only safe and reliable burner on the market.
Send for full particulars.

SIEVERT OIL BURNER CO. 1005 N. Alameda St. Los Angeles, Cal

National Wood Pipe Company

Woodward Pat. Machine Banded Pipe, Wheeler Pat. Continuous Stave Pipe, Bored Wood Water Pipe

Household Department

If

If I could only serve him,
How sweet this life would be!
Last night I dreamed my darling,
Alive, returned to me.

I brought him from the cupboard
The things he liked to eat—
The little piece of honey,
The rye bread and the meat.

I sang the song he asked for
The night he went away.
How was it, when I loved him,
I could have said him nay?

I took the time to please him,
With hand upon his brow,
Amid the awful leisure;
There was no hurry now.

How strange I once denied him
What took so little while!
A kiss would seem so simple,
So slight a thing a smile!

With pleased sweet looks of wonder
He took what I could give—
Such words as we deny them
Only because they live.

The pale light of the morning
Shone in upon the wall.
Come back to me, my darling,
And I will give you all!

—[McClure's.

A Matter of Compatibility

IN magnetism there are attractive and repellent currents which, though invisible, are none the less forcible. Just so there are attractive and repellent forces in people which are not only invisible, but are only brought out under certain conditions.

A man stepped into a restaurant in South Dakota and, looking about for a table, saw another man eating his supper whom he approached.

"Hello, Smith!" he said. "What are you doing here?"

"Hello, Runlet!" said the other. "Sit down."

Runlet sat down, and the two compared notes as to what had happened since they had last met several years before. Then Runlet said:

"But you haven't answered my question."

"Well, since you are an old chum and I am pining for a confidant, I'll tell you. Five years ago I married a girl who promised to make me the best kind of wife. She had apparently everything to render her lovable. We married and on the honeymoon quarreled. That wasn't the worst of it. We kept on quarreling. In my treatment of her there was nothing I had not used toward other women without antagonizing them—and I was obliged to conclude that she had a bad disposition. I think she came to the same conclusion of me, and after many efforts on the part of both of us to reform our dispositions we finally agreed to separate. It was arranged between us that I should come out here and get a divorce."

Runlet listened to this with marked attention, and it appeared to have considerable influence over him.

"They say," he replied, after some thought, "that matrimony is something half the world is trying to get into and the other half is trying to get out of. For a year I've been hunting a woman I wish to marry. I met her last summer on a train between Chicago and San Francisco, and we fell in love with each other on the journey. When I admitted my part of it she turned pale and told me that those were the only words of love that must ever be spoken between us. She wouldn't tell me why or give me any information concerning herself. Had I known when we parted that I could get no rest without her I would never have lost sight of her."

"I hope," said Smith, "that you will find your love and be happy with her. For me, I am only anxious to be free, and when free I shall remain so."

Neither converted the other to his way of thinking. Runlet left the next day, and Smith a week later secured his divorce. He did not see his wife again and in a year lost track of her. They had no children to continue between them either a pleasant or unpleasant interest. They had come together as two ships passing at sea and after a brief tarry together had passed on with as little interest in each other as when they had first met.

Five years after the meeting of Smith and Runlet in a South Dakota restaurant they met again. This time it was in a corridor of a hotel. Runlet espied his friend and, advancing cheerfully, put out his hand.

"Did you ever find your first love?" asked the other after the first greetings.

"Indeed I did, or, rather, she found me. Not long after I parted with you I received a message from her. I wondered how she knew my name and address and discovered later that she had seen it on my trunk while we were traveling together. I went to see her. She withdrew her objections to our union, and we were married."

"And happiness followed the honeymoon?"

"Like a never setting tide. We are happier every day."

"To what do you attribute such happiness?"

"Carlyle says that genius is unconscious. It is so with love. We don't consider why we are happy together. I sometimes think we don't realize that we are happy. But when we are parted we are miserable."

"That woman must be a jewel."

"She is. Come and see for yourself. I shall expect you to dine with us this evening."

Runlet gave his address, and his friend promised to be on hand.

When Smith called, Runlet was at the telephone and asked Mrs. Runlet to go down and receive the guest, excusing him till he should have finished at the phone. When he went down Smith and Mrs. Runlet were sitting talking in a constrained manner natural under the circumstances. Runlet, to make them more easy, introduced them, speaking words of praise for both. They soon went in to dinner, where Runlet recounted at the table the story of his and Smith's meeting some five years before. Then he went on to say:

"Mr. Smith, my dear, was not so fortunate as I in his matrimonial affairs. Pardon me, old man. I know my wife will sympathize with you. I know, my dear, Mr. Smith to be one of the best men in the world. Any woman who couldn't make him happy is not good enough for him or for any good man."

After dinner Smith pleaded an engagement and hurried away. Runlet joined his wife in her boudoir and found her on a sofa with a bottle of salts to her nose, which she was sniffing between gasps.

"For heaven's sake, my dear, what's the matter?'

"He was my husband!"

NELSON MAXWELL.

A LIBRARY BOOK'S PLEA.

Once on a time a library book was overheard talking to a little boy who had just borrowed it. The words seemed worth recording, and here they are:

"Please don't handle me with dirty hands. I should feel ashamed to be seen when the next little boy borrowed me.

"Or leave marks on me with your pen or pencil. It would spoil my looks. Or lean on me with your elbows when you are reading me. It hurts.

"Or open me and lay me face down on the table. You wouldn't like to be treated so.

"Or put in between my leaves a pencil or anything thicker than a single sheet of thin paper. It would strain my back.

"Whenever you are through reading me, if you are afraid of losing your place, don't turn down the corner of one of my leaves, but have a neat little bookmark to put in where you stopped; and then lay me down on my side, so that I can have a good, comfortable rest.

"Remember that I want to visit a great many other little boys after you are throught with me. Besides, I may meet you again some day, and you would be sorry to see me looking old and torn and soiled. Help me to keep fresh and clean, and I will help you to be happy."—[Rev. Henry D. Maxson.

WALK RIGHT.

Never allow your physical standard to drop. Keep up your energy; walk as if you were somebody and were going to do something worth while in this world, so that even a stranger will note your bearing and mark your superiority. If you have fallen into a habit of walking in a listless, indolent way, turn right about face at once and make a change. You don't want to shuffle along like the failures we often see sitting around on park benches, or lolling about the streets, with their hands in their pockets, or haunting intelligence offices, wondering why fate has been so hard with them. You don't want to give people the impression that you are discouraged, or that you are already falling to the rear.

Straighten up, then; Stand erect! Be a man! You are child of the Infinite King. You have royal blood in your veins. Emphasize it by your bearing. A man who is conscious of his kinship with God, and of his power, and who believes thoroughly in himself, walks with a firm, vigorous step, with his head erect, his chin in, his shoulders thrown back and down, and his chest well projected in order to give a large lung capacity; he is the man who does things.

You cannot aspire, or accomplish great or noble things so long as you assume the attitude and bearing of a coward or weakling. If you would be noble and do noble things, you must look up. You were made to look upward and to walk upright, not to look down or to stumble along in a semi-horizontal position. Put character, dignity, nobility into your walk.—[Success.

"Riches are intended for the comfort of life, and not life for the purpose of hoarding riches. I asked a wise man, saying, "Who is the successful man, and who is the unsuccessful?" He said "That man was successful who spent and gave away, and that man unsuccessful who died and left behind."—[Sa'di.

THE CARE OF THE EYES.

People who recognize the importance of taking care of their health often quite forget that if we want to preserve them it is just as necessary to take care of our eyes.

First of all take care of your general health. Poor health often leads indirectly to various eye troubles.

Glare and gloom are equally bad to work in. You need not ask which is the worse for the eyes—one is as bad as the other.

The light should fall on book or work from behind us. The attitude while at work is of great importance. The head should, as far as possible, be kept erect. Stooping causes an increased flow of blood to the head and eyes—this is injurious to them.

Dont' read when traveling. Deny yourself this pleasure for the sake of your eyes.

THREE CARROT WAYS.

Carrot Pie: This can hardly be told from squash pie. Scrape and boil the carrots until tender, using plenty of water. When done, drain and pour cold water over them. Let stand five minutes, then mash. To make good-sized pie use 1 cup carrot, 1 pint milk, 4 tablespoons white sugar, ½ teaspoon each salt, cinnamon and ginger and 1 well-beaten egg. Bake slowly, using one crust.

Roast Carrots: Scald the carrots until the skin can be removed, then place them in a pan with a roast of beef or pork. Turn them once in a while and baste when you do the meat.

Mashed Carrots: Boil until tender, put through a vegetable squeezer, and add butter, pepper and salt. Stir over the fire until hot, then serve at once. This is a good substitute for squash.

ALMOND CREAM SAUCE.

2 tablespoonfuls almond paste.
Juice 1 large orange.
4 tablespoonfuls cream.
1 cupful boiling water.
3 tablespoonfuls sugar.
1½ tablespoonful cornstarch.

Take one one-fourth of a cupful of the water to mix with the almond paste, mashing and stirring until smooth, then turn it into the boiling water and add also the sugar and cornstarch, which have been well blended. Stir until the sauce boils and thickens. Add the orange juice and cream a moment before serving.

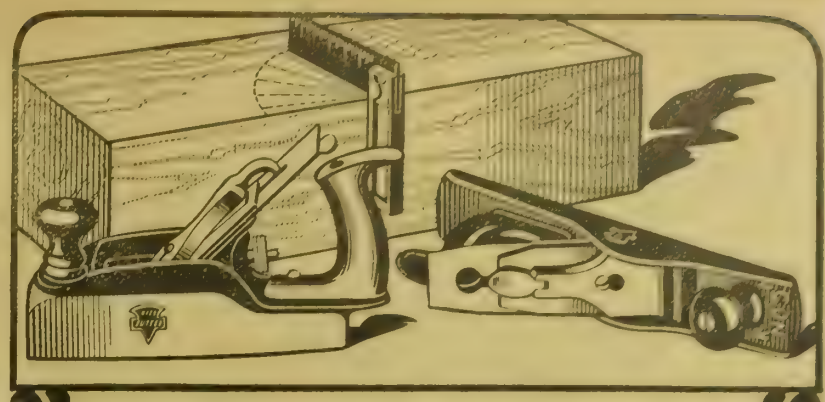
ALHAMBRA BONBONS.

½ cupful blanched almonds.
1-4 cupful seeded raisins.
1 to 1 1-2 teaspoonful honey or maple syrup.

Run the almonds and raisins together through a meat chopper, putting through twice, if necessary, to secure a fine-grained mixture. Stir in the honey or maple syrup, a little at a time, using barely enough to make a paste that can be shaped into small balls. When these are made out, roll them in a mixture of granulated sugar and ground cinnamon, or, if something more elaborate be desired, roll them in blanched almonds chopped moderately fine. They also make a delicious filling, placed between halves of English walnuts in the manner of creamed walnuts.

Freddie—What's a hobby, dad?
Cobwigger—A hobby, my boy, is hard work that doesn't pay anything.

Piles Cured In 6 To 14 Days.
PAZO OINTMENT is guaranteed to cure any case of Itching, Blind, Bleeding or Protruding Piles in 6 to 14 days or money refunded. 50 cents.



True Tools

You can't square up a block with a lop-sided plane—saw straight with a buckled saw or bore a clean hole with worn-out bit. To do a good job you must have good tools. That's the reason men who have used and studied tools a lifetime insist on having

KEEN KUTTER

QUALITY TOOLS

They show their excellence not only in actual use, but at *first glance*—the "hang," balance, finish and careful adjustment being apparent. Keen Kutter Tools include not only Carpenter Tools but a full line of Farm and Garden Tools—Forks, Hoes, Shovels, Garden-trowels, Grass-shears, Rakes, Manure-hooks Pruning-knives. To get the best tool of its kind simply ask for a Keen Kutter. For 37 years Keen Kutter Tools have been sold under this mark and motto:

"The Recollection of Quality Remains Long After the Price is Forgotten."

Ten Reasons

WHY THE

Addison Pump

Is Better Than All Others

1. It will pump more water with less power.
2. It is more substantially constructed.
3. Has no overhanging bearings to spring and cause friction.
4. Absolutely uniform motion—does not break rods.
5. Plunger leathers can be changed with less trouble and expense.
6. Water discharge in continuous stream—no pulsation.
7. Noiseless in operation.
8. Has no jar or hammer.
9. Perfectly balanced, so no braces are required to keep pump in position.
10. Will be in good working order when pumps with erratic or variable motion are in the scrap pile.

The "ADDISON" pumps more water for the amount of power consumed and with less liability of breakdown than any other pump.

With the recent changes in the factory and management we are prepared to make quicker delivery, and a better pump for less money than ever before.

It will pay you to write us for catalogue and prices before purchasing a pump.

When in town call at the factory and see our pumps.

FOR SALE—THRIFTY YOUNG WALNUT Trees from 5 to 8 feet tall, grown from selected soft shell nuts, $25 per hundred. A. M. Hoel, Goleta, Santa Barbara County, Cal.

AGRICULTURAL EDUCATION.

(Continued from Page 27.)

for yourself on every hand. Scientific agriculture is simply the aiding of nature to carry out her plans. It is simply a thorough investigation of nature's laws. Disobey one of them and suffering is the inevitable result.

The time has come when it is no longer the man that arises with the first faint streak of dawn and labors until day has turned to night that is the successful agriculturist. It is no longer the man who can work the longest hours and do the hardest work that prospers, but rather the man that has been trained for his agricultural pursuits, the man that thinks, the man that spends a few minutes in the morning planning for the day's employment, the man that studies, experiments, and investigates, and when once having determined upon a conclusion, follows it with all his might, he it is that is the successful farmer and can live to enjoy the fruits of his labors.

SALTING ASPARAGUS BEDS.

While good asparagus, as is well known, may be grown without applications of salt, it is possible that on asparagus soils, soils of the sandy type, still better asparagus might be grown with it. It is certain that in the usual quantities it does no harm to the asparagus on such soils. It is known to have a binding or compacting effect on lighter soils, and tends to improve capillarity, while, owing to its hygroscopic character it tends directly to increase the moisture in the soil. Even if impracticable under present methods to use salt in the large quantities needed to secure its effect, it is certain that under the old time method of growing asparagus it was well nigh a necessity and answers a good purpose still where asparagus is planted closely in beds. Planted thickly, as was the custom, it was almost impossible to keep the bed clear of weeds by any other method. The large quantities of stable manure used annually brought a fresh supply of weed seeds, especially grasses, rendering hand work tedious and expensive. Salting proved an efficient, cheap and harmless substitute.

The writer has used asparagus along division and back fences where it serves the double purpose of ornament and use. It softens and hides the obtrusive division fence, with its airy growth proving indeed ornamental. It occupies ground that is often not otherwise occupied and at the same time such plantings can be made to furnish a family supply of a delicous vegetable. It is true that with the attention usually given the product is not comparable to the truckers' product, but a very fair article may be so grown and as it is for home consumption its smaller size is not seriously in the way. Here salting again answers a good purpose; waste brines may be put to use. This combination of utility and ornament in many instances is not desirable, but here we have one in which ordinary objections hardly apply.

THE SUCCESSFUL FARMER.

Ever and anon we hear of the successful farmer and in imagination we wander away to broad, well-tilled acres, large red barns, large houses with beautiful lawns, fine stock, etc., but we do not stop to consider the enormous amount of real hard work that was entailed in bringing about this condition of things. There are no hard and fast rules whereby success can be assured in this great profession, but there are certain principles that make for success, and to these the following bear loyal tribute:

I shall name a few elements which a farmer cannot well do without to be successful. Make farming a specialty. I have been farming for twenty years, and I never have found much time to devote to any other profession. I have stuck close to agriculture and stock raising, and I think I have been rewarded for it. I well remember when I was a small boy, of hearing the saying "Jack of all trades and master of none." Ever since I have kept that in mind. I would rather be a special somebody than a general nobody. The different sciences are so deep and wide that one person cannot master all of them, or even many of them.

A successful teacher makes teaching a specialty, a successful lawyer makes the legal profession a specialty. I know there are some good farmers who are lawyers, good teachers who are farmers, and good farmers who are doctors, but if you should ask them if they thought that they would not be more successful if they should make their profession a specialty, they would tell you yes. The most successful men we have today in any profession are specialists.

Many times since I have been farming, other things have been presented to me, with offers of good wages, but I could not spare the time off the farm, which needed my undivided attention. The right thing needed to be done right at the right time, which if I failed to do, and do well, my work was not satisfactory to myself. I believe the keynote to success in farming is to do the right thing at the proper time. I have never well done anything but that I was well rewarded and well pleased with my work.

PLANTING CUCUMBERS.

There are almost as many methods of planting cucumbers as there are growers. Some plant them in hills the standard distance of 6 feet apart each way; others plant in hills 6 feet apart in one direction and 2 or 3 feet apart in the row, while others plant in drills or broad belts 6 feet apart and chop out the plants to stand about a foot apart in the row after all danger from insect depredation has ceased. The methods which seem most economical under the conditions at hand will of course be adopted by the grower.

Don't be afraid of overfeeding; find out how much your fowls need. There has been a lot of underfeeding of late on account of this cry of overfeeding in the press.—American Poultry Journal.

California Horticulturally

By JOHN ISAAC, Sacramento, California

The Fruit Grower and the Chinese

THE late Fruit Growers' Convention at Hanford, was one of the best ever held in the State. It fairly well attended, and some remarkably good papers were presented. A resolution advocating the virtual repeal of the anti-Chinese law came as a thunder-clap to very many people in the State, but those engaged in orchard work or other agricultural pursuits can thoroughly understand and sympathize with the advocates of this resolution. The fact is that we have scoured the United State for good farm labor and we have emptied the schools during the picking and packing season and have sent our emissaries all through the East to induce young men to come to California hoping that the superior wages offered here would secure them. But each year has shown a lessening among the number of workers until today a very large percentage of our fruit and farm crops are absolutely lost for lack of sufficient help to harvest it. It has been found impossible to secure white labor of any account in sufficient quantities, and our growers have turned to the Japanese for assistance only to find them thoroughly unreliable and following the example of many of their white brethren, abandoning their employment as soon as they see that their employer is in a pinch. It has practically come to the stage now where the agfiriculturist must have Oriental labor or curtail the work on the farm to the capacity of his own family. It is very quesionable whether any one of the members of the Fruit Growers' Convention who voted for these resolutions is favorable to the introducing of coolie labor, but it has become with them a "dernier" resort, it is that or nothing; available help or bankruptcy.

RICE CULTURE.

We notice that another effort is being made in the line of producing rice in the Sacramento Valley. Several attempts have already been made in this direction but have failed, for some unknown reason, probably lack of knowledge or skill. There is no reason why vast areas in California, both in the Sacramento and San Joaquin Valleys, should not be cultivated to this desirable cereal. The conditions are all but perfect in soil, climate and abundant water supply. We are now importing immense quantities of rice from China, Japan, Hawaii, and also from the Southern States. It might be produced at home and add very largely to our agricultural wealth. With the steadily advancing cost of living, especially in meats, the masses of the people will naturally turn to other classes of food, and we know of none so completely filling all requirements as does rice, and we know no section better adapted to its culture than Northern California. We shall watch this experiment with much interest, and trust that it may be successful, and the means of introducing a new and profitable industry to the farmers of California.

NEW METHOD WITH PRUNE.

One of the papers which aroused most interest at the Fruit Growers' Convention was by J. Luther Bowers of Santa Clara, on "A Fixed Price for Prunes and How to Obtain It." Mr. Bowers has been experimenting with a process of his own for canning cured prunes so that they will keep for an indefinite time and always in good condition. They are put up in available packages and at moderate prices, but sufficient to insure the grower a fair profit. Lack of sufficient means has prevented Mr. Bowers from introducing his process on a large scale, but after hearing his paper and examining his fruit, the convention passed a resolution endorsing the same, and providing for the appointment of a committee to take up the work with him and endeavor to extend our markets. It is not improbable that the outcome of this will be some organization that will put up prunes by the Bowers plan, on a large scale, and introduce them into the markets of the East and Europe. There are two things required in the sale of any article, first, that it must be meritorious; and secondly, that it be made known. We have spent much time in advertising the prunes of California, but very much of the product put up in boxes or bags, when delivered to the trade was utterly valueless and hence all the advertising was worthless. If, however, we can put up a good article and then force it upon the public, it is not improbable that it may be made a household necessity, and prune growers will never have to face a deficit in their business.

HORTICULTURE ORDINANCES.

There is an assortment of county ordinances pertaining to horticulture in the different counties and the State, some of them going so far as to absolutely prohibit the importation of certain plants or vines within the counties. It has been charged that measures of this kind are unconstitutional and will not stand the test of the courts, but the horticultural commissioners will enforce them until they have been threshed out before the proper authorities.

The latest in this line is an ordinance passed by Yuba county, which, among other provisions, prohibits importation of any grape vines into that county unless accompanied by a certificate from the Horticultural Commissioner to the effect that there has been no Phylloxera or Anaheim disease existant in the county from which they are imported for at least five years preceding the date of importation. This practically puts an embargo on the importation of vines into that county from outside points, as it is exceedingly doubtful whether any one in the State could issue a certificate to that effect. No one knows positively that either the Phylloxera or the Anaheim is, or has been absent from any county in the State for the past five years, and therefore could not make a certificate to that effect.

The question of winter egg productio is of vital importance to every poultry raiser. You want eggs for market when the price is highest; you want eggs when eggs are still scarce for early hatching. If the hen is kept in proper working order and is given the proper materials with which to make eggs, she can't help laying, even should she want to help it. If you comply with these two things, you'll have eggs in abundance all winter long.

SELLING POULTRY PRODUCTS.

Those who know how to produce "fancy" eggs and other poultry products are the ones who reap the richest harvest in this line of business, for in this case a high class trade may be built up in a short time with but little effort on the part of the producer.

Keep pure-bred fowls so that the eggs will be nearly uniform in size and color. The food consumed by the laying hens has a great deal to do with the size of the eggs; if it is not rich enough in albumen the eggs will be small. A strictly fancy egg must be large; not less than two ounces in weight, new laid, spotlessly clean and free from any foreign flavor due to improper feeding. No tainted meat scraps, musty grain or strong-flavored vegetables, such as cabbage or onions, should be fed to hens which are catering to the tastes of the wealthy consumer.

To secure and hold this high class trade is not at all difficult, for quality sells itself and "a satisfied customer is the best advertisement." A high grade product put up in an attractive package is what the critical buyer wants. If the package is even a trifle dilapidated it is at once taken for granted that the contents are inferior. This applies particularly to packages shipped to the consumer.

Farmers and poultrymen living near large cities should endeavor to build up a retail trade among the wealthy class, who are willing to pay a little above market price for fresh eggs, dressed fowls, etc. Be careful that all eggs sold are fresh, i. e., not over a week old. Therefore, it is never advisible to depend upon neighbors to supply one's customers at times when eggs are scarce. Unless one is reasonably sure of a good supply of eggs from his own flock during the fall and winter months, it is folly to undertake to build up a fancy trade or to sell to retail customers.

One Way of Selling.

A good way of disposing of poultry products is to furnish reliable commission merchants and grocers with fresh eggs and choice broilers. Each egg must be stamped with the producer's name and each dressed fowl tied with a colored cord around the body to hold it in shape. A small tab with the poultryman's name should be attached. For stamping the eggs a small rubber stamp is used. An egg bearing the words, 'Gordon's Fresh Eggs," is sure to be good, because this is the "brand that won't come off," and the buyer knows that the producer would not dare to risk selling an egg of doubtful age. Therefore the buyer never has to wonder what the quality of 'Gordon's Fresh Eggs" is going to be. When the grocer is asked, "What are eggs worth?" he replies, 'Eggs 20 cents; fresh eggs 24 cents; eggs from Gordon's 28 cents." When inquiries are made for broilers in early spring, the grocer invites his customer to see what he has in this line and of course the customer selects Gordon's though the price is from 4 to 8 cents higher than that of the others.

To make a demand for strictly fresh eggs or nicely dressed fowls is not beyond the reach of any progressive person. Of course, after the quality once becomes known, practically the demand makes itself. Then one should bear in mind that the quality of the product must never get below the standard. Those who live close to cities or large towns should lose no time in building up a trade along these lines.—Cor. in The Home Monthly.

THE TOMATO.

Since the prejudice in regard to the poisonous qualities of the fruit has broken down and improved canning processes have come into use the tomato has become a very important commercial field and garden crop. It is a fruit which, as before stated, has no definite season. It is relished at all periods of the year in a fresh state, and is equally welcomed upon the table, when properly cooked or prepared, whether it has been freshly taken from the vines or has been preserved in cans As a result of the extensive use of the tomato it is now cultivated both as a field and as a forced crop, though little is done in glass grown tomatoes in California. In field culture, however, the acreage is being double each successive season.

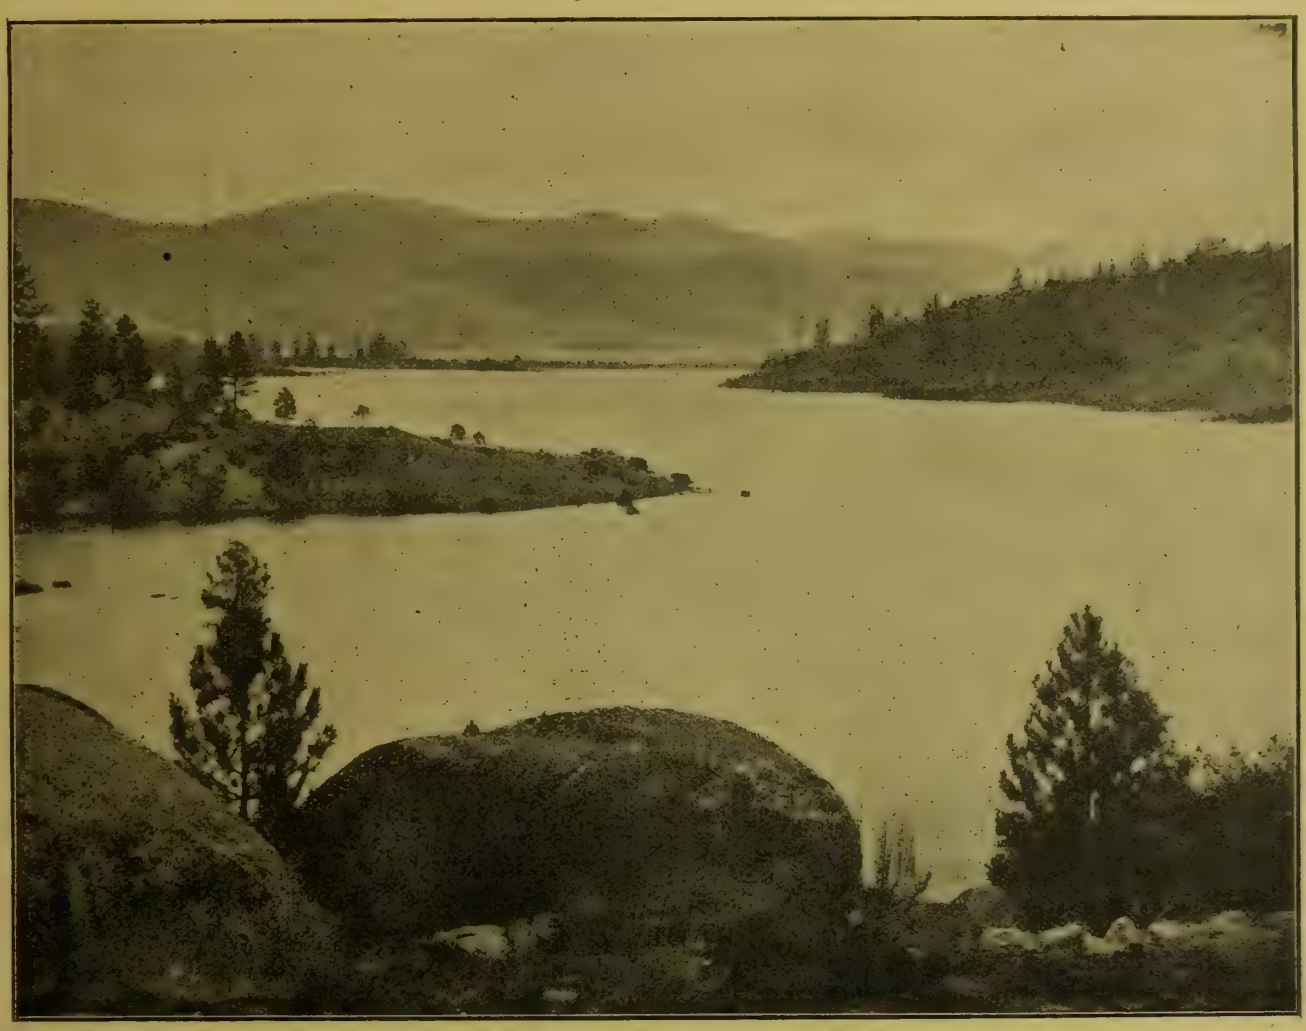
California Cultivator

Los Angeles January 17 1907 San Francisco

General View of Lake Hemet



CALIFORNIA climate is due in large measure to the fact that the average annual rainfall is but about one-fourth that of the Atlantic Coast and the Mississippi valley. Thus the necessity for an adequate supply of water for irrigation purposes becomes of such importance that the saying: "Water is king in California" is recognized as a truism. Especially is this true since the three successive years of drought, 1898, 1899, and 1900, during which time there were few water systems in Southern California, aside from that supplying the Hemet lands, that stood the severe test.

The Lake Hemet Water Company in the year 1890 began the construction of the great Hemet Dam across the South Fork of the San Jacinto River, at a point 4,400 feet above sea level and 800 feet above the town of Hemet.

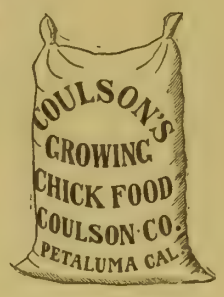
This dam is the largest piece of solid masonry in the West and was completed in 1895. It is 250 feet long. 100 feet thick at the base and 122 1-2 feet high, or about the height of an ordinary ten-story "sky-scraper" building.

The river here enters a deep gorge or steep-sided canyon, flanked on either side with almost perpendicular cliffs of solid granite. A wide valley extends from this point back several miles into the mountains, forming the bed of what is now Lake Hemet, the source of the water supply for the Town of Hemet and surrounding valley.

In addition to the ample security afforded by the great reservoir, a partially developed artesian well belt, situated near the head of the lake, is in itself capable of supplying enough water for a large area. Nineteen wells have been sunk in this water-bearing land, and have yielded by actual test over one hundred inches of water continuous flow. Only a small part of the belt has been developed. The elevation of over 4,400 feet above the level of the ocean makes this artesian belt the most remarkable in the United States.

The water-shed supplying Lake Hemet contains over 100,000 acres. From its altitude and the fact that it consists of wild, uninhabited mountain wastes, there can be no contamination of the water supply. From the dam the water flows for ten miles through a natural channel, the rocky bed of a gorge or canyon, where it enters the pipes, flumes and cement ditches of the water system, to be conducted to the homes of the residents of the valley.

The water all comes from the rain or snow in the high mountainous regions and is kept entirely free from all deleterious matter, thus ensuring perfect purity and the softness that is so beneficial for either domestic use or for irrigation purposes.



Coulson's Growing Chick Food

Is a mash feed for the growing chicks, designed for feeding when you leave off feeding Coulson's Special Dry Chick Food, composed of articles, each the best in its class, combined in the correct proportion to form

A PERFECT BALANCED RATION

It contains blood meal, meat meal, bone meal, and other articles rich in protein, and the other elements, and is the feed you need to make your chicks excel in size and weight and enable them to become strong, vigorous and heavy-laying fowls.

COULSON'S GROWING CHICK FOOD WINS OUT

San Marcos, Cal, July, 23, 1906.
Gentlemen:

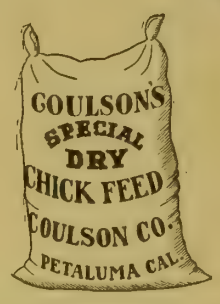
I tried COULSON'S GROWING CHICK FOOD exclusively my first year in business on Brown Leghorns. I sold the cockerels as broilers at nine weeks, averaging 2 pounds, 3 oz. each.

I tried my own mixture of feed the next year and took the same care of the chicks, and sold 75 cockerels as broilers, weighing 105 pounds, making an average of about 1 1-4 pounds each.

Having tested at my own expense the two methods I have concluded that COULSON'S FOOD is superior.

(Signed) J. B. HOOVER.

USE COULSON'S AND BE SATISFIED



Coulson's Special Dry Chick Food

Is acknowledged by all The Best and most Reliable Feed for Baby Chicks.

COSTS LESS THAN 2 CTS. FOR FIRST FOUR WEEKS

NLY HIGHEST QUALITY GRAINS, ETC,, USED

Special Dry Chick Food contains numerous different seeds adapted to needs of the little chicks, besides meal, charcoal, bone and many other necessary articles, each in Granulated form making

A PERFECT BALANCED RATION

CANNOT PRAISE IT ENOUGH

"I cannot say enough in writing in praise of your Special Chick Food. It is just fine. I never saw chicks do so well before."

J. S. SCOTT, Madison.

PULLETS LAY EARLY

"I have fed your Special Chick Food and Growing Chick Food to all my stock with one exception. I tried one lot of 350, and fed them my way of raising chicks back East. Results just fair. The other were fed up to three months on your Special Chick Feed, and the results were a surprise to me. The birds were large and the cockerels out of one lot I sold to the California Market and got a big price, with the request to send on to them at any time I had more cockerels of the same quality."

Respectfully, A. P. WARD,
Calistoga.

COULSON'S SPECIAL IS THE BEST, AND "THE BEST IS THE CHEAPEST"

Citrus Trees in Marly Subsoils

A Review of the Observations and Experiments Made in Various Countries Regarding the Relation of Marl to Chlorosis of Citrus Trees

By DR. E. W. HILGARD, University of California

IT WAS early ascertained by this Station, and has been repeatedly stated in its publications, that the majority of California soils, in common with those of the arid regions generally, is calcareous in the sense of containing lime enough to produce all its advantageous effects. In the humid region generally, these effects have very frequently to be brought about by artificial liming or "marling," an operation which but very rarely is of practical use in this State.

It is also well known that "overliming," or the use of too much lime or marl, is very injurious to many culture plants. The case in point best known is probably that of the phylloxera-resistant grapevine stocks brought to France from the Northern United States. The soils in the grape-growing regions of France are very commonly marly, and the result was the chlorosis, or yellowing of the leaves, and general failure of the American stocks on soils whose lime-content would not affect the European vine injuriously at all. The latter is credited with enduring even as much as 40 per cent. of lime carbonate in the soil, while some of the American resistants are injured by as little as 5 per cent. of the same. Hence the mission, a number of years ago, of Professor Viala of Montpellier with a view to finding, in the strongly calcareous lands of Texas, a phylloxera-resistant grapevine which would also resist chlorosis. Viala was successful in this quest, and the stocks and hybrids from the Texas vines now form the main basis of "reconstituted" vineyards in France.

Marly or excessively limy soils are quite exceptional in California, so much so that until recently only one case of chlorosis resulting from that cause had come to the knowledge of the Station. The yellowing of orange and lemon leaves, not uncommonly observed at some points in Southern California, has throughout been due to other defects in the subsoil, which weakened the root-growth or gave rise to fungous disease.

Citrus orchards in the Great Valley have thus far been remarkably free from some of the troubles noted south of the Tehachapi; the chief complaints having been caused by the effects of water-seepage from high lying ditches in the foothills. The soils themselves have not been found in fault except where it was attempted to plant orchards on heavy clay subsoils, or hardpan; emphasizing the need of a careful examination of the substrata of any land designed for tree culture.

Quite lately, however, complaints of yellowing and languishing of citrus trees grown in apparently the best quality of loam soil in the Porterville region have come to the Station. Portions of young orchards planted on low ridgy land were found to become diseased, their leaves yellowing and dropping; while those located in lower ground continued to grow thriftily. The samples of soil and subsoil (the latter taken to the depth of from 3 to 5½ feet in accordance with the directions given from the Station) showed that while in the lower ground where the trees were in good condition, the subsoil at 3 feet contained only 12 per cent. of lime carbonate, on the higher land it was full of white lime-nodules in the third foot; and that the fine earth around them, in which the roots vegetated, contained from 22 to 39 per cent. of lime carbonic. This evidently exceeds the tolerance of citrus roots, hence the yellowing of the leaves. In another similar case, examination showed that even where the trees were doing finely (the soil being very rich,) the calcareous layer was reached at from 4½ to 5½ feet. It is probable that so soon as with progressive growth the roots reach the above depth they will here also be affected by the excess of lime.

This is a condition which perhaps cannot be remedied by any applications made to the land. When lands have been injured by artificial overliming or excessive marling, the effects can be neutralized by the use of organic matter, usually applied in the form of stable manure, a procedure already prescribed in the classic treatise of Marling, by Ruffin of Virginia, early in the last century. But it is clearly impossible to apply this remedy in the case of lands naturally underlaid by marl; at least in the arid region, where roots penetrate to depths unknown east of the Mississippi. No vegetable material could be artificially applied at depths of several feet. Inquiry has been made whether it would not be possible to neutralize the lime by some acid; but this, even if financially possible, would surcharge the upper layers with a substance more injurious than the excess of lime itself. Possibly an antidote may be found in some soluble compound of magnesia.

Such lands should, simply be given to some other culture than citrus trees; and among these, grapevines on their own roots, or upon some of the lime-resistant varieties developed in France, will be found available wherever the loose soil extends to 4 or 5 feet depth. Other cultures resistant to marly soils are the fig, stone fruits on Myrobalan or Chickasaw-plum roots, and the quince; also most legumes.

It should be kept in mind that calcareous geological formations extend along the Sierra foothills from the Merced River south through Fresno and at least northern Tulare county, and can be observed in the bluffs of the streams as they emerge from the foothills. It is perfectly easy for any one to test these whitish materials for lime, and to recognize the lime hardpan in subsoils, by a few drops of muriatic or nitric acid, or even strong vinegar; which will cause them to "effervesce" or "fizz" from gas bubbles driven off by the acid. A bit of chalk or limestone can be used for comparison, thus gaining some idea of the liminess of the material. Long low ridges extending valley-ward from the foothills may be suspected of being marly, and should be examined as to the nature of their subsoil before planting. Entirely similar conditions exist locally in portions of the Santa Clara River Valley, and on some other Coast Range streams in the south. Also at a few points in the Santa Cruz range.

The matters discussed above emphasize from an additional point of view the need of subsoil examination in the arid region especially, because of the deep rooting of all plants and particularly of trees. It seems desirable to call attention to another and very obvious mode of recognizing any unusual conditions of soil and subsoil, viz., the native vegetation. It may be said in brief that the native vegetation is ordinarily the outcome of centuries and millennia of "natural selection," which results in the predominance of the species of plants best adapted to the native growth must be presumed to express the same facts and adaptations which we subsequently find out laboriously by the successes and failures of various crops. What we need is to be able to interpret correctly the indications presented to us by the native growth.

To some extent this has been and is daily done by farmers all over the world, who buy wild land in accordance with the indications of the tree growth where such exists. In many Eastern States the official assessment of lands is habitually based upon the natural tree-growth, and the judgment of experienced men on this basis is rarely at fault, and has even excited the envy of agricultural chemists.

In the eastern United States and in the humid region generally, the presence or absence of an adequate supply of lime in the soil is largely the determining factor of the vegetative character; more so even than the moisture conditions, which are commonly credited with being the chief governing condition.

In the arid regions, where lime is almost universally present in soils to the needful and useful extent, moisture is undoubtedly the dominant factor causing differences in native vegetation. We are therefore deprived to a large extent of the signs by which good lands are recognized by the Eastern settler, the more as forest growth is not so abundant in the arid region. We must, in order to utilize the indications of the soil-character by native vegetation, observe not merely the kinds and development of trees on the ground, but also the shrubby and herbaceous growth; noting not only the presence but also the absence of plants prevailing in the neighborhood, from certain portions of the area.

Every-one in California knows the "alkali weeds," which tell him that the land on which they grow is more or less impregnated with salts; many, have learned which of these plants indicate land which under present conditions it will not pay to try to reclaim. Now just as some plants will resist a greater or less amount of alkali salts than others, so some plants are tolerant of an excess of lime in the soil, while others will refuse to grow, or at least will not naturally be found occupying, ground containing more than the limited amount of lime, which is in all cases desirable.

The infrequent occurrence of marly lands in California, already referred to, has been the cause of the fewness of observations made in regard to the distinctive natural vegetation of such tracts. It is evidently very desirable that such observations should be made for the benefit of future planters of orange orchards; and the marly ridges of the Porterville region afford a good opportunity for this purpose. Undoubtedly some of the shrubs and herbaceous plants prevailing elsewhere in that region will be found wanting on the

Not All Manure Spreaders Pay

The Idea of spreading manure properly is such a good one and the benefits derived are so great you are apt to think *any* spreader will give you these benefits—that a spreader is a spreader.

There is where you may make a mistake, for some spreaders are only trouble makers and the second season they are not taken out of the shed. To make them work takes too much time and costs too much money.

If you get that kind of spreader you're apt to conclude that spreaders are made to sell and not to spread manure.

SUCCESS SPREADERS

have 28 years' experience back of them—thousands of them are spreading manure on the best farms in the country and are giving no trouble.

Twenty-eight years has eliminated the trouble making features—out of a hundred new devices and schemes that we have tried perhaps ninety have proved more harmful than helpful. They make good talking points but they don't help spread manure. SUCCESS Spreaders are made to spread manure.

When you get ready to buy a manure spreader, (and every farmer should have one) first write for our spreader book, it will help you; next go to your local dealer and see a Success Spreader but don't buy one until you have asked a man who has used one. He knows.

Deciduous Fruit Culture

By J. W. MILLS

Horticultural Freaks

IT IS about time that the advertisements for new things in fruits will show up. Two years ago it was the seedless apple that was given free advertisements by a large number of country newspapers whose editors did not know the difference between a peach tree and a pumpkin tree (if the pumpkin vine happened to climb the tree.) They actually told of an apple which grew on the trees without blossoms. The tree never having blossoms, it was impossible for it to lose its fruit from frost. It had no seeds and therefore the codlin moth could not infest it, because the pest could not live on apple flesh, it must have apple seeds to eat. Several papers actually published these absurdities and wrote editorials on the subject hailing with delight this new wonder and claiming for the introducer, I should say faker, more credit than they ever gave Burbank for his meritorious creations. Now, if the tenderfoot farmer had kept his eye on the Cultivator, no second thought would have been given by him to such nonsense. But there will be new introductions of the same class by some faraway inventor. Reliable and experienced horticulturists are quick to take up new things which are likely to prove worthy and it is well to ask the opinion of some of this class before taking up with these new things that drop out of a clear sky.

CALIFORNIA VINE DISEASE.

Professor Pierce has used this name in preference to the "Anaheim" disease and it is a good idea. The Pernicious scale is known all over the United States as the San Jose scale, because it first showed up there. The California vine disease is now found from one end of California grape growing districts to the other, and while the ravages of the phylloxera has been circumvented, this disease seems to baffle all attempts to conquer it.

Prof. Pierce found that the Lenoir seemed to resist the disease to such an exteht that old vines continued to bear as much as eight tons per acre in the midst of old vineyards, which had long since died of the disease. This lead him to experiment with seedling varieties crossed with Lenoir, in the hope that he might get favorite varieties to restore their desirable qualities and also to inherit some of the resistant qualities of Lenoir. How successful he has been in this we do not know. We regret to say that his work was discontinued when the Plant Introduction Garden was established at Chico. No doubt this work will be carried on by others. It is perhaps the only successful method of controlling the disease, though it has been said that there were indications that it would loose its virulency after awhile There are others who claim that with wide experience they have never detected any such signs. We have noticed in one particular case where an outside row in a vineyard of several varieties, part of the vines died of this disease during a period of four or five years. After that none were affected and continued to bear heavy crops each year. All of this variety were on in an outside row, showing that all had even chance. A few of another variety died of the same disease and after a lapse of several years none have died during the time. Sultana showed all the symptons, on some vines, the bunches of grapes dried up just before ripening, the leaves had the characteristic marking and the canes ripened the way peculiar to the disease.

These symptoms prevailed for two years, but the vines did not die. They have never been prolific bearers either before or after the appearance of the disease.

TREES FOR THE NURSERY.

The nurseries are not entirely faultless, nevertheless much blame is frequently placed on them for which they are in no way responsible. Trees usually come from the nursery, in bales or boxes. A bale is made by placing the trees with their roots all together and tieing them. Straw or long hay is usually wrapped firmly around both the roots and tops and the whole sewn up with burlap. This is then moistened and shipped. On arrival at its destination much of the moisture is apt to have evaporated, the amount, depending upon the condition of the weather and the aridity of the climate through which the trees must pass on their railroad journey. On this account every precaution should be taken to inform oneself when the trees are at the depot, so that they may immediately be taken care of and not left for several days or a week drying on the platform. If the bale looks dry it is a very good plan to immerse it, tops and all, in a pond or irrigation ditch until thoroughly soaked, say for about ten or fifteen minutes. If the holes have not been dug and everything is not ready for planting, a trench about a foot deep should be made with a plow or shovel, turning the dirt all one way. Nearby a hole should be made in which is prepared a mixture of dirt and water about the consistency of thick soup. The trees should then be taken singly and doused up and down in the mud, the roots placed in the trench and then covered over with the mound of soil until none are exposed. Trees if treated in this manner when taken from a bale or box will keep in perfect condition for several weeks, and of there is any danger of the tops sprouting owing to warm weather cover these also with dry straw or hay to keep the light away from them.

LARGE OR SMALL TREES?

The time of year for fall setting of trees is near at hand, and many people are preparing to plant new orchards, or add to what they already have. We think it would be only a fair estimate to say that two-thirds of all the trees planted throughout the southern part of the United States will be peaches, owing to the high prices paid for this fruit the past two years, and there will be hundreds of thousands of all sorts and sizes set out this season.

When arranging for new plantings most people prefer good, large-sized trees—four and one-half to six feet high, which, anyone will admit, are good trees for planting, provided they are thrifty and not over one or two years of age, and many will hestitate to plant smaller, expecting that with the growth already made they will gain a year in fruiting. But my experience has been such as to make me

believe that this idea is misleading. I do not think there is any advantage to be gained in planting the larger trees. It is true that a great many successful orchardists prefer to plant the larger-sized trees, but I am convinced that this is more a matter of preference than of profit.

Experience is a better guide than theory in the matter, as is the case in every phase of fruit growing. It has been through experience and observation that I have been led to form my opinions. I do not wish my readers to understand me to say that I condemn good-sized one-year-old trees, for that is not my intention. What I wish to do is to show the true value of the small tree.

In an orchard under my observation a few years ago a goodly lot of trees were set out. Some were two-year-old seedlings, some large, thrifty, one-year buds, some June buds, and still others were dormant buds. Three years later I noticed this orchard and found the trees nearly all the same size, the June buds being a little thriftier looking and all bore some fruit that season.

In uprooting and transplanting a small tree, the root system is not so very badly disturbed, while in a large tree it is much mutilated and diminished. Hence the small tree grows off more readily and rapidly, and gets well started, while the large one is repairing cut and broken roots, and getting ready to grow, and in the course of two or three years the June buds will catch it every time.

It is true that a two-year-old tree is full of fruiting buds, and if set out in November, may bear a few stunted specimens the next season. But that amounts to nothing and will be a greater stunt to the tree. Do not plant the June bud and expect it to thrive among the weeds and grass. But manure the ground well and cultivate thoroughly, and with this treatment I believe you will be induced to believe as I do, that there is nothing better for fall planting than the June bud.

ROTATION AND WEEDS.

The value of rotation in ridding land of weeds is well illustrated by two plats at the Minesota Experiment Station. One plat on which wheat has been grown continuously for eleven years, is quite badly infested with wild oats. Another plat two feet away from the first one, on which a five-year rotation (wheat grass, oats and corn) is followed, is free of wild oats.

If any farmer who is troubled with any of our common annual weeds will lay his farm off in convenient shaped and sized fields, and follow a system of rotation using a well-cultivated crop of corn once in five years, and one to three grass crops during the same time, he will have but little trouble with weeds will increase the products of his farm until he will consider the weeds a blessing for having forced him to change his method of farming.
—Southern Farmer.

"My dear sir," said the man who felt that his ability had been questioned, "I would have it understood that I am a self-made man."

"That's all right," replied the other. "Just keep quiet about it and no one will get wise."

"Have pity on me, darling" pleaded the poor but otherwise honest young man; "I cannot live without you."

"What's the matter," queried the homely heiress; "have you lost your job?"—

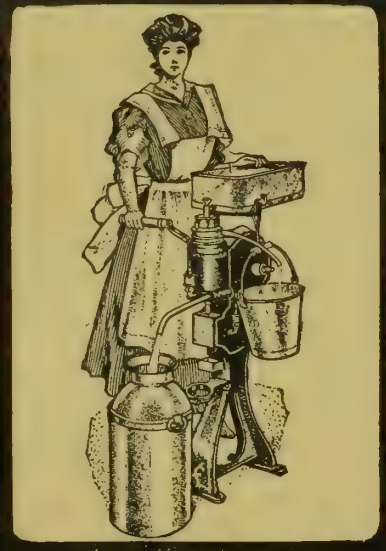
U. S. CREAM SEPARATOR



WEARS LONGEST

as well as skims cleanest. Time has proved the simple, strong construction of the U. S. is more durable than any other separator.

Used 14 Years
Repairs 75 Cents

Fond du Lac, Wis., Nov. 8, 1906.
To whom it may concern:
I have used one of your U. S. Separators for the past **fourteen** years and it has given the very best satisfaction. I have paid **75 cents** for extras since getting the machine. I cannot recommend the U. S. too highly. J. Balson.

27 pictures with plain, easy-to-understand explanations in our new catalogue, make the construction and operation of the U.S. as plain as though the machine was before you. Let us send you a free copy. Just write: "Send Construction Catalogue No. 20". Write today.
Don't buy a Cream Separator before you see this book.

VERMONT FARM MACHINE COMPANY
Bellows Falls, Vt.
Eighteen distributing warehouses centrally located in the United States and Canada

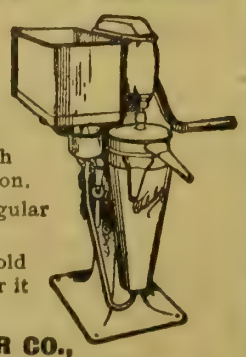
1½ lbs. more butter

If you can increase your butter production without any increased cost or any more work won't it pay you to do it? And if you can get more butter from you milk with **less work**, that will be still better, won't it? That's exactly what you can do if you will do as Mr. Leiting did—buy a **Sharples Tubular Separator.** Here's what he says about the Tubular:

Randolph, Nebraska, Feb. 15th, 1906.
Gentlemen:—On the 23rd day of January, 1906, I took a No. 4 Sharples Tubular Separator on trial. On learning that I was in the market for a cream separator, the agent for the disc style "bucket bowl" separator brought one to my farm and requested me to give it a trial before making a purchase. After giving both machines a fair trial, I concluded to keep the Tubular as I consider it far superior to the other machine. It skims closer, runs easier, and is very much easier to wash, there being so many less parts. **From three skimmings of milk from 7 cows, we were able to make 1½ lbs. more butter with the Tubular than we could with the "bucket bowl" machine.** B. LEITING.

The Sharples Tubular Separator

MORE BUTTER MORE MONEY



gets all the cream there is in the milk, does it so easy that it's not work to run it at all, and is so simple, with only one little part in the bowl to wash and keep clean that comparison is out of the question.

The extra cream it gets makes the **Tubular** a regular savings bank for its owner.

All the other good money-making points are told in book F-260, which you ought to read. Write for it today—we'll send it **free** to you.

Live Stock and Dairy

To Judge a Horse

THE following is attributed to Zenophon, the famous Greek writer, who lived more than 2,300 years ago. It can scarcely fail to be interesting reading:

"I write how not to be deceived in the purchase of a horse. If the horse is an unbroken colt, one must judge him by the construction of his body, as, if he has not been ridden, one cannot know from experience what his disposition is. It is first necessary to examine the feet; for, as in the case of a house, where it does not matter how fine the superstructure may be, if the foundation is imperfect, the horse is of no value if he has not good feet.

"Look first to the horny portions of the hoof, for those horses with thick hoofs are superior to those horses with thin hoofs. Next, it should be noticed whether the hoofs be upright before and behind, or low and flat on the ground. The high hoofs keep the frog at a distance from the ground, while the flat hoofs press equally with the soft and hard part of the feet. Strong-footed animals can be known by the sound of their tramp on the hard earth, but the hollow-hoofed foot rings like a cymbal when it strikes the earth.

"It is desirable that the parts above the hoofs and below the fetlocks (the pasterns) be not too erect, like those of the goat, for legs of this kind, being stiff and inflexible, are apt to jar the rider, and are more liable to inflammation. The bones must not, however, be too low and springy, for in that case the fetlocks are liable to be chafed and bruised when the horse gallops over clods and stones.

"The bones of the shank should be thick, for these are the columns that support the body; but the veins and flesh on them should not be thick. If they are thick, then when the horse is galloped over rough ground the veins will fill with blood and become varicose, so that the shanks will be thickened and the skin become distended and free from the bone. When this happens the back sinew gives way and the horse becomes lame.

"If the horse, when walking, bends his knees flexibly, he will also have flexible knees when going at a faster pace. Horses increase in flexibility of the knees when they increase in age. Flexible goers are highly esteemed, as they should be, for such horses are less liable to stumble than when they have rigid, unbending joints.

"If the arms below the shoulder-blades be thick and muscular, the horse appears handsomer and stronger than otherwise, as in the case of men. The breast should be broad as well for beauty as for strength. This also causes better action of the fore legs, which do not then interfere, but are carried well apart.

"The neck should not be set on, like that of a boar, horizontally from the chest, but, like that of a game-cock, should be upright towards the crest. The head should be long, but the jawbone should be small and narrow, so that the neck will be in front of the rider, and the eye will look down at what is before the feet. A horse of this conformation will be less likely to run away, even if he be a high-spirited horse, for horses do not attempt to run away by bringing in but by thrusting out their heads and necks.

"Note whether the mouth is equally hard on both sides. If the jaws are not equally sensitive the horse may be hard-mouthed on one side or the other. It is better to have the eye prominent than hollow, as the prominent eye will see further than the hollow one.

"Wide nostrils are better for respiration than narrow ones, and they give the war-horse a fiercer aspect. The higher the crest and the smaller the ear, the more horselike and handsome is the head. High withers give the rider a sure seat and produce a firmer adhesion between the body and shoulders. A double loin is also softer to sit upon, and better to look upon than if it be single.

"A deep side rounded toward the belly renders the horse easier to sit. He is also stronger and can more easily be kept in condition. The shorter and broader the loin, the more easily will the horse raise his fore quarters and collect his hind quarters under him in going. These points cause the belly to appear smaller. It it be large it injures the appearance of the animal, renders him weaker and less manageable. The quarters should be broad and fleshy, in order to correspond with the sides and chest. If they are firm and solid the horse will be light in the gallop and will be speedy."

STARTING AN ANGORA FLOCK.

Those who enter upon goat raising must of course make their operations conform to their capital, the same as in any other business. They will find that desirable does will cost from $5 to $12 each and bucks all the way from $50 to $100 each; so that a large herd of this kind, although preferable, will cost a small fortune and is beyond consideration by most people who will engage in the industry. Another plan that may be pursued by one who has limited capital, but time and patience to wait, is to begin with a few first-class animals and build up a flock from these. The result will be satisfactory and the only drawback is the length of time required. After all, this may be the wisest plan for most beginners to pursue, as the experience so necessary to success will be gained as the flock increases. The Turks many years ago began the practice of crossing Angora bucks upon Kurd does. They probably had in mind the two fold purpose of producing thereby a hardier goat than the pure Angoras and of increasing the number of goats in order to supply the increased demand of Europe for mohair. Crossing the Angora bucks upon the common goats of the United States has been practiced since their introduction and the results have been satisfactory in many respects. Many of the large flocks of Texas and New Mexico have had Mexican does for their foundation. Building up a good mohair producing flock upon this plan requires five or six years. The advantages are that the does with which the beginning is made are cheap, costing from $1.50 to $2.50 a head. During the first and second crosses there are many twin kids, thus increasing the herd in that pro-

For a Good, Practical Milking Machine see the O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

See Us for Sanitary Milk Bottles. O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

portion—a condition not existing except to small extent among the pure-bred Angoras; the size and hardihood of the progeny are increased and the liability to disease decreased. Care should be exercised in starting a flock by this method to select only such common does as are entirely white for any other color, however slight, is objectionable. If otherwise, the results might be satisfactory but the probabilities would be the contrary. In handing the crosses the breeder often finds that atavism becomes apparent when it is most objectionable. For instance, the progeny for two generations of a doe having black spots might appear all that is desirable while the third generation would produce the latent color. It is also quite necessary that the common does should be of the short haired variety. —Field and Farm.

ABOUT DEHORNING CATTLE.

Wil you tell me, asks a subscriber from Moorpark, whether there is any law, human or divine which justifies dehorning cattle.

Strictly speaking the practice of dehorning cattle, is not sanctioned by any human or divine law, yet in the keeping of many head of cattle together, whether they be milch cows or fattening animals, it becomes well nigh a necessity. Their horns in a state of nature are their implements of war, and also of protection. Domestication has made it unnecessary for cattle to have horns for protection; but domestication of cattle, like the civilation of man, does not take the warlike, mean temper out of many of them; and in the case of cattle, there will scarcely be found a herd of ten without one which will be mean toward its fellow, and take seeming delight in hooking and goring the others in the herd. The first thought in all such cases would be to remove the horns from this pugnacious one and let the others go. But cow nature is much like human nature; when the others see the one without means of defense, one and all they seem inclined to vent their spite upon it and will abuse it. Hence, in order to keep peace in the herd, dehorning becomes well nigh a necessity.

PROFITABLE PIG FEEDING.

Dr. Warrington, "in chemistry on the farms," states that for each 100 pounds of feed consumed the gains are: for cattle, 9 pounds; sheep 11 pounds; and pigs, 23 pounds, or pigs make nearly two and one half times as much gain from a given amount of feed as do cattle.

Analyses show that for every 100 pounds of the digestive nutrients consumed cattle gained 12.7, sheep 14.3, and pigs 29.2 pounds, thus showing the great value of hogs on the farm for profit to the farmer, and why it has become an adage, that the hog is the rent payer, the mortgage lifter, and farmers' cashier.

The hog can sell the farmer's corn through his stomach at a better price than any other animal on the farm. This makes pigs a desirable farm animal, not only because of the fact that they can convert more pounds of meat out of a given quantity of feed, but because at the present time they can be marketed as quickly as a field of grain. At the same time it is more profitable than selling grain, not only because there are better prices received for it, by feeding it to the hog, but because the farmer looks farther ahead and retains the fertility of the soil in feeding back that produced from it.

The profit of pig feeding depends upon the cost of the feed given them. Therefore, anything that cheapens the feed increases the profit and especially if it is not done at the expense of the health of the hog.

COWS AND EDUCATION.

Berea college, Kentucky, which is patronized by the mountain whites of that State, is probably the scene of more hard efforts to get an education than any other institution in the country. A few years ago a mountain boy and his sister led a cow thirty miles over the mountain to Berea, walking every step of the way. They rented two rooms, boarded themselves, and earned their own way through school, and the biggest item of their income was the milk they sold from the cow.

They went back home and sent two younger ones ones to school. The old cow stood stanchly by and helped the second pair through. Seven members of the family have either been graduated from Berea or are still in the school, and they have all brought along a cow to help them through, although it was not always the same cow.

THE HIGH HEADED HORSE.

The best way to get high-headed horses, according to the Chicago Live-stock Journal, is to breed them with vim and the natural high-head conformation with the head and neck well set on top. The horse with the head set on low down in front or the low-necked horse can not be made to carry a graceful head and neck by checking him up. It only represents the driver as cruel or thoughtless, and the horse as badly built. The high head in all classes of horses is indicative of intelligence, energy, and vim that is an important factor in the market value and price of the horse, a characteristic of good breeding and superior quality, inherited from the proud, handsome Arab of the desert in his perfect conformation. Never breed to a stupid, down-headed horse that has to be anchored up with a check-rein.

The high-knee action, like the handsome, high-headed horse, is bred that way, with the conformation for high action and high head that always commands a premium on the market, whether draft or driver. If these characteristics are bred in, it stamps the value of the horse and attracts the admiration that only the high class horse can command; it is an indication of good breeding. Good action is a market requirement that should be kept in mind by the horse breeder.

SHORT HORN SALES.

Mr. H. P. Eakle, Jr., proprietor of The Enterprise Stock Farm at Woodland, reports that the sale of shorthorns at that place on December 29th, was extremely satisfactory, and he has determined to hold another at nearly the same time next fall. Mr. Eakles, received some very good prices, his fine bull Barmpton Lad bringing $550 and several others, both young bulls and heifers brought from $100 to $150 each. Seven females brought $660, averaging $94.30, and nine bulls brought $1447.50, an average of $161.67.

Others who sold were W. B. and T. B. Gibson, who sold 22 heads of calves 14 males and 22 females at an average of $42.27, and Robert J. Ashburner, who obtained an average of $84.32, for 11 head, consisting of 9 cows and 2 bulls. All the buyers were residents of this State, so that all of this most excellent lot will remain here.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

"Reliable Strain." The Business Hen of the Twentieth Century

465 Custer Ave., Los Angeles, Cal.

FIRST PRIZE COCK

The Reliable Strain Triumphant Over All

At the L. A. C. P. A. show Jan. 7th to 12th in the keenest comtition with the Clement & Fike, Fishel, and Dustin Strains, our birds won as follows: 1st cock, 2nd cockerel, 2nd and 4th hen, 3d pullet and 3d on the pullet trophy pen. Winning six ribbons and four silver cups, two being for the BEST DISPLAY OF WHITE WYANDOTTES in the show.

We have HONEST BIRDS that lay HONEST EGGS which we sell at HONEST PRICES.

Settings from our Special Mating headed by "Reliable 1st," our 1st prize cock bird, mated with our prize-winning pullet trophy pen still stand at $3.00 per setting, $8.00 for fifty eggs. Not over fifty eggs from this pen to any one customer.

Our "BOOKLET" tells all about our breeding pens and with prices that fit all pockets. We are now booking orders for spring delivery.

Order early to avoid disappointment.

I am Pacific Coast Agent for Reliable Incubators and Brooders—the best Incubator on earth. Write for catalogue and net prices laid down at your door. I have a few extra fine breeding cocks and cockerels that I will sell at a reasonable price.

F. A. MASON, Manager.

Southern Chief DISC PLOWS

Built with Special Reference to the Requirements :: of PACIFIC COAST Farmers and Orchardists ::

These plows are made entirely of steel, malleable and cast iron. They are well braced, strong and easily controlled. The three disc can be converted into a two disc, and the four disc is easily changed into a two or three disc. A farmer having a two disc can make a three disc by securing the extra parts.

LEVER RODS SLIDE THROUGH ADJUSTABLE CONNECTIONS

Keeping the Levers and Operator Always in the Same Relative Positions.

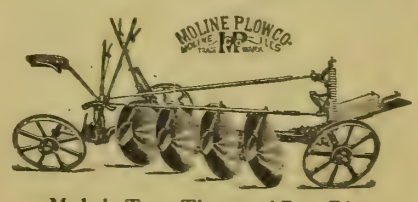
The location of seat, wheels and hitch are right, giving good penetrating power and permitting of turning to either right or left. The front wheel is under control at all times and the plow can be steered at will.

The Orchard Axle Attachment

with which either size of these plows can be equipped is a splendid thing for orchard plowing, and especially where it is desirable to work up under the branches close to the trees.

Permits of Closer Work than Can be Done with a Walking Plow

The plow with this attachment can be used for general work as well as for orchard plowing.



Made in Two, Three and Four Disc

SIMPLE WITHOUT SACRIFICE OF STRENGTH, AND THE QUALITY OF WORK CANNOT BE EXCELLED BY ANY DISC PLOW AT ANY PRICE

All levers are convenient for the operator, easy to control in raising or lowering plow and for guiding purposes. The bearings are long and made of chilled cast iron, insuring wearing qualities. The foot trip for rear wheel permits the plow to turn either way, and also serves as a raising lever. The method of raising and lowering front furrow wheel is sure to be a source of delight to the operator. It does away with the inconvenient lever in general use, which is usually too long on a two disc and too short on a three disc. The elacticity of the spring board hitch relieves the plow of dead shock and severe strain.

ASK YOUR DEALER TO SHOW YOU THESE PLOWS

Send us your name and address, enclose four cents in stamps to pay postage and mailing, and we will send you our Flying Dutchman Song Book and Junior Catalogue Combined, containing Twenty-six Old Familiar Songs with words and music.

MOHAIR GROWERS ASSOCIATION.

Mr. F. A. Pierce suggests that this paper organize a marketing association for the mohair growers of the Pacific Coast. The work of organizing a business association of this kind is outside of our regular work and we are not able to undertake it. Our columns are freely open, however, to those who are willing to undertake the work of effecting such an organ ization. An association to cover the ground suggested by Mr. Pierce will take a good deal of time to perfect. It will need a substantial capital and will require the services of a thoroughly competent business manager and of an experienced and reliable mohair sorter. Such men can not be picked up quickly and without them the work of the association will not be apt to give satisfaction. It is not too soon to commence work now on an organization to get it ready to handle the clip of 1908. It is too late to get one in working order for the clip of 1907. We have frequently pointed out the fact that ungraded pools of mohair must inevitably defeat their object in the long run, but they are frequently helpful as a temporary expedient. With the amount of mohair now produced in Josephine county and under the existing conditions it will probably pay the mohair growers of the county to pool their coming clip. If in doing this, they make a local organization of some strength, provision can be made for deducting a small percentage of the proceeds of the pool as a fund to be used toward the organization of a Coast marketing association. Unless the mohair growers of a county are willing to get together in a local organization and contribute their pro rata share of the expenses of forming a general association it is useless for individuals to go on with the work. If a pool of the coming clip in Josephine county is organized, send a notice of the fact and of the date of sale and the address of the person or committee in charge of the sale to this paper and it will be published free of charge. Oregon Agriculturists.

DEVELOPING THE DAIRY COW.

Calves should be fed in such a way as not to impair either growth or digestion, for later on we are going to ask them to take care of a lot of feed so that they may develop and be profitable animals. If fed and cared for in a careless and harmful manner their digestive organs are impaired.

Discussing the subject in an exchange, Mr. M. Stinson says:

"I am still a believer that heifers should not freshen too young. If allowed to drop their first calf at from 28 to 30 months of age they will get a little more growth and strength, and we believe their digestive capabilities are also strenghtened.

There are many things that enter into the development of the dairy cow, and possibly if one was dropped the best results could not be obtained, and the man that uses that part of his body above his ears the most freely usually succeeds best.

We have come to believe that a large part is due to the feed. The organs of digestion, like the other organs and muscles of the body, are developed best by constant use. The breeder that through neglect has not provided in some way for the emergencies is short-sighted.

We all know that when a cow once shrinks in her milk how hard it is to get her back, and quite often it is impossible, even with the best of feed; so it stands us in hand to provide in some way for these times, and either have some soiling crops growing or enough silage stored up to supplement the short pasture of summer; also to supply succulent feed for winter use.

I believe there is such a thing as compelling success. Every breeder should have such a complete understanding of his business and the individual needs of each animal so that there is no time in the year when she may not have an abundance of good, rich, juicy foods, best suited for milk production. The successful development of cows rests largely on the breeder's equipment.

LOSING COLTS.

Experience has taught one farmer to avoid allowing a mare with foal to see a slaughtered animal or smell blood, as the result, he claims, will be the loss of the colt. He says:

"There are some people who are inclined to doubt this. One trial, however, will usually convince them otherwise. One instance that we know of will prove the truth of what we say; we could give others. A farmer had killed a hog that he found too heavy to raise by hand. A mare in the barn was harnessed, so he brought her out to use in hauling up the carcass. She was a quiet old mare, and paid no attention whatever to the carcass. In three or four days, however, the chances of a live colt in the spring were out of the question."

"By the way, dear," began Mr. Bluffington. "I met a fellow today"——

"Yes," interrupted his wife, "I know."

"Eh? How do you know?"

"I smelled it on your breath."—

The Great American Hen.

The greatest thing in the United States today is the hen. Her portrait "rampant" ought to appear on every dollar, half, quarter and dime that Uncle Sam puts out; for the actual fact is "Biddy's" business brings in more of those same dollars, halves and quarters than any other single— and I might almost say double—American industry. Three hundred million dollars' worth of poultry products is "Biddy's" yearly contribution to the farmer's pocketbook, and if the exact truth were known, a goodly number of those three hundred millions were **made by men and women who have studied how to feed the hen.**

Such men use good, sound, chicken sense. They begin with young chicks, and follow a consistent system of feeding all through the life of the hen; using with the regular ration, that wonderful discovery of Dr. Hess—Poultry Pan-a-ce-a—which builds healthy flesh, bone and feathers, and makes early laying a habit. Now let me say right here that Dr. Hess Poultry Pan-a-ce-a is not a stimulant. Rather, it is a health-giving tonic, which helps the hen to get out her food all that Nature would otherwise supply.

Poultry Pan-a-ce-a helps the hen to digest her food properly, which of itself gives her health and vigor. It aids assimilation—every grain or particle of food goes where it is most needed, to build bone, flesh, feathers, or to make eggs, so that the greatest possible good is realized in the least possible time.

The saying that "an ounce of prevention is worth a pound of cure" is doubly true in the poultry business. The wise hen man cures his hens before they get sick, and his one certain agent for doing it is Dr. Hess Poultry Pan-a-ce-a.

Poultry Pan-a-ce-a and Instant Killer are the result of long study and experiment under just such conditions as the farmer meets with in his own yards.

Dr. Hess & Clark, of Ashland, Ohio, are so confident of the good you will get from these preparations that they are willing to give a written puarantee with every package. The cost is so small it's hardly worth considering.

Cream Separators, all sizes, all prices. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

The Vegetable Garden

By ERNEST BRAUNTON

The Banana

THE people of the United States consumed over seven million dollars' worth of imported bananas in the year 1902. Each year the importations are increasing and at the rate of nearly a million dollars per annum in value. A West India Bulletin states that in the height of the season, upward of twenty steamers per week leave Jamaica alone laden chiefly with bananas for the markets of the United States.

Comment is unnecessary upon what this trade has done for Jamaica, particularly since the decline in the sugar industry. Banana growing is today one of the most profitable industries in that island, notwithstanding the fact that tornadoes sometimes destroy whole fields. Further, the indirect influence which this trade has had upon tourist travel can not be easily estimated. The frequent passage of steamers has attracted thousands of people to the West Indies to spend the winter.

Soil Requirements.

There are two essential features of a good banana soil. The first is abundant moisture, the second, good drainage. It is true that the banana makes a large demand upon the fertility of the soil, especially upon the supplies of potash; but if there is a lack of plant food it may be made up in fertilizers. It is of first importance that there be a plentiful supply of moisture at all times, and quite essential that there should be good drainage. Stagnant water is very injurious.

Temperature and Location.

The banana will endure quite low temperatures, but commercially it is a tropical plant and grows most rapidly and luxuriantly in high temperatures. This is an important factor in determining the location for a banana plantation.

At sea level the Chinese or Cavendish banana will fruit in about twelve months from planting, but as the altitude increases and the air becomes cooler, the time required for fruiting is greater. The element of time, with its results in the number of bunches per year, is a factor to be reckoned with when judging of the suitableness of a given locality for this industry. Bananas do not require shade, as coffee, and trees are simply in the way and use up food which should go to the crop. To do this will require some expense at the beginning, but incomplete clearing is a doubtful economy and can only be regarded as a compromise to be made when capital is lacking. A cleared field means: 1st, Cheaper tillage; 2d, better tillage; 3d, larger crops of high-grade fruit; 4th, greater facility in handling the crop.

AUSTRALIAN STRAWBERRY CULTURE.

In making a new plantation of strawberries virgin land should be selected if possible, or, failing that, land that has been down in pasture for a few years is the next best. It has been the experience of most strawberry growers that land which has been in cultivation for a few years does not produce good crops of fruit. A rich loamy soil is one of the best for strawberries, although some varieties thrive well on a stiffer soil, and good crops have been obtained from very sandy soils, in the granite soils good crops of fruit have been grown.

In preparing the land for planting, it should be ploughed in the springtime to a depth of 9 to 10 inches, and hoe. In small plantations where the work is done by hand, 2 feet apart in allowed to lie fallow till the summer. If weeds should appear, give a good scarifying with the disc scarifier, and then level all down with the ordinary harrow. Later a second ploughing should be given, and the land gathered into lands 24 feet wide if the soil is dry, and lands half that distance if the soil is at all damp; give a good harrowing, and the ground is then fit for planting as soon as rain comes.

The earlier the plants can be got in the better for a good spring crop. They should be planted in rows, 3 feet apart, and about 1 foot in the rows from plant to plant. This gives plenty of room for cultivating with the horse the rows would be sufficient. After the plants have been put out, it is necessary that should be kept clean from weeds. On this depends a good deal of the success of the plants the first year, and will involve a good deal of labor in hoeing and weeding; weeds take a good deal of killing in the winter time.

Keep the beds all clean and free from weeds in the spring time when the plants are in bloom. It will then be necessary to mulch the plants with straw to keep the fruit clean. Some growers mulch with long manure, but this is objectionable. Others use spent tan from the tanneries, but it is apt to promote fungoid growths, which are detrimental to the plants. On the whole, clean straw or dry grass is much the best material to mulch with. During the summer keep the hoe going occasionally to keep the weeds down.

Crimson Winter Rhubarb

Original Burbank Strain

$1.50 per Doz., $6.00 per 100, $40 per 1000

Now is good time to plant. We are the only Rhubarb Specialists on the Coast. We devote most of our time to its cultivation and improvement. We have the Best pedigreed plants ever offered of this wonderful money maker. Write or call on

SOW WESTERN SEEDS IN WESTERN SOIL

Here's a SPECIAL OFFER to make New Friends for LILLY'S Northern Grown Seeds

LILLY'S BEST Vegetable seeds are grown on and adapted to this coast. These 10 varieties are the aristocrats of the kitchen-garden. They represent the acme of Lilly effort, the result of years of careful seed selection and cultivation. This Special Offer gives you $1.50 in these seeds for $1.00. Read the descriptions, all of which are carefully and conservatively made. Living up to the catalogue description is what has built up the reputation of Lilly's Best Seeds.

PUGET SOUND SPECIAL TOMATO.

This miniature, from a photograph, gives you an idea how the tomato produces. Is an early dwarf, stands free from the ground, with hard, firm, round stalks. Yields large clusters of round, firm, luscious fruit, beautiful rich color, free from blemish, stands shipment splendidly. A three-season leader; popular everywhere. Perfected by us on our experiment grounds at Brighton Beach, and can be obtained solely from us. Sold only in sealed packets. Ounce, 60c; packet, 10c.

GOLDEN JERSEY WAX BEAN.

Brittle, tender, broad, thick—the best of all the yellow pod bush beans. Stringless. Beautiful golden color and delicious flavor. Vigorous, reliable, and an abundant producer. ½-lb., 25c; packet, 10c.

JACK FROST SWEET CORN.

Plump, milky kernels, that melt in your mouth; tender, sweet, prolific—really phenomenal. Dwarf variety, permitting close planting. Very hardy. Jack Frost seed has been perfected by ourselves on Puget Sound, is thoroughly acclimated and peculiarly adapted to Pacific Coast conditions. Not only season's earliest, but longest and latest producer. We cannot say too much in endorsement of this corn. Large packet, 15c.

LILLY'S GLORY CABBAGE.

Glorious in flavor, gloriously sound, a glorious grower and a glorious shipper. Lilly ships tons of this cabbage seed across the continent, as this variety, perfected on Puget Sound, is admitted to be the best cabbage grown. Even rounder and more solid than the Danish Ball Head, and infinitely better adapted to Pacific coast conditions. True to type, every head like its neighbor, symmetrical, white inside and solid to the core. ¼-lb., $1.25; 1-oz., 35c; packet, 10c.

PRIDE OF THE PACIFIC CUCUMBER.

Almost a seedless cucumber, the seeds being small and few. Perfectly smooth, very dark green, beautiful white flesh, perfect cucumber flavor, exceptionally firm, crisp and delicious. Grows 10 to 18 inches long, always straight, and dark green until ripe. Vine hardy and vigorous; enormously productive; yields early and late in season. ¼-lb., 65c; 2-oz., 40c; oz., 25c; packet, 10c.

ENGLISH FORCING LETTUCE.

Large, crisp, tender; best variety for home culture, because easily grown outdoors or in frames; rich color, ideal for garnishing. Hotels gladly pay one-third more for this lettuce. Stands more neglect in watering, and does not quickly run to seed. Most profitable for market purposes because quickly ready in fine large bunches of beautiful light green, which never spot. ¼-lb., 50c; oz., 20c; packet, 10c.

MT. RAINIER PEA.

Dark, rich green, well-filled pods, creamy and delicious; enormously productive. Propagated in Washington, and the best early pea ever offered to western growers. Especially valuable for market gardeners, commanding the highest prices through the season. Large packet, 10c.

CRIMSON GLOBE BEET.

Close grain flesh, very sweet, tender, blood red, delicately zoned with white. Exceedingly smooth surface. Finest in form, flavor and color. Free from woody, fibrous roots. Grows uniform in size—about three inches through. Matures early. Pkt., 10c.

GOLDEN HALF-LONG CARROT.

Best of all the yellow varieties. Very sweet, close in texture, golden yellow, solid, very smooth, attains large size, has small core, and adapted to all soils; under good cultivation yields 25 to 30 tons per acre. Ready for table at all times during growth. Equally valuable for stock. A market favorite. ¼-lb., 25c; packet, 10c.

CRIMSON GIANT RADISH.

The larger it grows the solider it gets; twice the ordinary size. As hard as a bullet, while tender and deliciously crisp. Retains goodness long after maturity. ¼-lb., 40c; packet, 10c.

SPECIAL PRICE OFFER.

$1.50 worth of above seeds for $1.00.

$1.00 worth of above seeds (one packet of each variety, with packet of Old Fashioned Flower Garden Seeds thrown in free) for 75c.

Six 10c packets, with Flower Garden packet, 50c.

Three 10c packets, 25c.

Above prices are postage paid.

Grow LILLY'S BEST SEEDS AND GROW RICH

Plant Lilly's Best Northern-Grown Seeds, grown on this coast for this coast, and be sure of profit. You will find that the saying, "Best for the West" is true in every case, and that Lilly's Best Seeds will give you best results. The above are only ten varieties of Lilly's Best vegetable seeds. For information as to the full line, write for

LILLY'S 1907 SEED CATALOG,

Which will be sent free, postpaid, on request. Lilly's 1907 catalog surpasses all previous books in attractiveness and completeness of plant information. It is thoroughly dependable, and besides containing descriptions, price lists and culture directions of thousands of varieties of seeds, bulbs, roots and cuttings, it is a handbook of information on poultry foods, poultry supplies, stock foods, fertilizers, garden supplies, sprays, horticultural supplies, etc. If you want one, free, mark an X in the white square.

HOW TO ORDER.

Mark an X in each white square opposite the variety of seed you wish to order, mark the quantity in square or on margin, figure up the total, clip out the ad., and remit in same envelope with the clipped ad. Be sure and write your name and address plainly, filling in the following blank:

Clip ad. and mail to

CHAS. H. LILLY CO.

Seattle, Wash.

Enclosed is $....., for which please send me $..... worth of Lilly's Best Vegetable Seeds, as marked above.

TREES

True to Name

The demand for all sorts of fruit trees promises to be heavier than ever before. Place your order now, before our assortment is exhausted.

Deciduous Fruit Trees

We have this season a superior stock of

PEACHES PLUMS
PRUNES PEARS
APPLES APRICOTS
CHERRIES OLIVES
NECTARINES

All grown under our personal supervision in our Nursery Plant No. 3, which has a rich river bottom soil, permitting the most perfect roots.

Citrus Trees

All grown at our Citrus Nurseries in the Great Thermal Belt near Exeter.

Nut Trees

ALMONDS WALNUTS
PECANS

In all the leading varieties.

Grapes

On their own roots and grafted on Phylloxera resistant roots. All the leading Table, Wine and Raisin sorts.

Berry Plants

Burbank's Crimson Winter Rhubarb

Ornamental Trees and Shrubs

Roses, Palms, Greenhouse Plants

We are the sole propagators and disseminators of Burbank's four new and valuable creations. Write for illustrated pamphlet.

Calimyrna Figs

Our Great Specialty

None Genuine without our Seal.

Also have a fine stock of **White Adriatic, Mission** and other standard sorts of Figs.

NEW CATALOGUE

Will be ready for distribution in January. It contains points about Pruning, Planting, is superbly illustrated. Will be mailed free.

Price list on application.

Economy in Fertilizers

WE WERE recently asked, "what is the most economical way to use commercial fertilizers?" This is easy to answer up to a certain point. There is no use of putting on fertilizers when conditions are such that the trees cannot use them. In other words, if the material is in an unavailable form the plants can't get hold of it, no matter how much there may be of it.

When soil is in the state where it will run together and pack tight every time it gets wet, there is usually a condition that indicates a lack of humus. Soil without humus is known to be slow in giving up its elements of fertility. There is abundant evidence that land that is rich in humus may contain much less plant food than some that produces much poorer crops. The reason for this is that the acid contained in humus and which is known as humic acid, holds in solution when wet, a very large quantity of the plant food contained in the soil. We are perhaps all aware that some soils prove unproductive, but upon an analytical test, show that they have a higher percentage of plant food than soils which produce much more. The story of Prof. Bailey and his three samples has often been told, but it is a good illustration and bears repeating. He was anxious to know something definite about this humus business, also the extent to which soil analyses could be depended upon. He took a sample of soil from the garden where the loam was rich, judging from the crop produced, a sample from a barren clay ridge and a corner of adobe wall. The adobe wall contained the highest percentage of plant food, the clay hill soil the next highest and the "rich" garden loam contained the smallest percentage of plant food, but it contained a much larger percentage of humus than either of the other two soils. That was the secret of its productivity. This striking example furnishes an easy answer up to a certain point, to the question, "what is the most economical way to use commercial fertilizers." The rest of answer may be in telling how to get the humus into the soil. Much humus cannot be put into the soil without breaking away from the old method of clean culture. Perhaps 90 per cent of the orange growers of Southern California have done this, but there are occasional groves in which the old clean culture method is still pursued.

After the soil is supplied with humus, there remains the question of amounts, time of applying and other questions which cannot be answered except after considerable experimenting. An experiment on one kind of soil will not give an answer that will be applicable to very many places, but it will furnish a guide by which all can make a start and the peculiar requirements of the various classes of soils will in time be worked out. It is our candid opinion that with soils which contain an abundance of humus, there will not be a very great difference in brands of commercial fertilizers just so long as the required elements are there. It may be that raw bone for instance will give just as desirable results as a more available form of phosphate.

This has been found true to a certain extent, but it has not been demonstrated in California. It is known though, that in the peatlands of Orange county, a dressing of commercial fertilizer gives more definite and quick results than on lands poorer in humus. The lands are so rich that it would seem folly to fertilize them. This is evidence that should encourage planting of green crops for fertilizers. The orchards of California have had clean culture for so many years, that the soil is in a great many place almost completely depleted of its humus. Stable manure has been the saving grace in almost every instance. This is expensive fertilizer, but the great demand for it is evidence that its good effects are apparent and while most growers attribute its beneficial effects to the direct fertilizing qualities, there is little doubt but that as much benefit is derived from the humus it delivers to the soil.

TO ASSIST FRUIT GROWERS.

The Bureau of Plant Industry of the Department of Agriculture at Washington is always willing to assist those who want information with regard to plant diseases, and has published the following instructions for those wishing to deal with the bureau:

When the farmer or fruit grower is in doubt regarding the character or name of any plant disease with which he has to contend, it is best to write to the agricultural experiment station of this State or to the United States Department of Agriculture, sending specimens for examination as hereafter directed. In most cases printed matter containing full account of the disease and its treatment can be furnished without cost.

Persons desiring to consult the department or a State Experiment station regarding any plant disease should write a letter stating the facts in the case, and if specimens are sent, giving notice of the same. This letter should not be enclosed in the package containing the specimens.

Packages containing specimens of diseased plants sent by mail are rated as fourth-class matter and require postage at the rate of 1 cent an ounce (16 cents per pound.) No written matter may be enclosed with the specimens except the outside of the wrapper.

No package may weigh over four pounds. Nothing should be sent that can in any way injure other mail matter. Liquids must be in tight bottles, packed in approved mailing cases. Postmasters will give all necessary information on request.

If the plants are small, send them entire, including roots. Loose dirt should be carefully shaken or washed off. Samples of the soil are not needed, and the dirt often injuries the specimens in transit. Choose plants representing various stages of the trouble. In the case of many leaf diseases, wilt and diseases of fruits, the earlier stages are usually most satisfactory. All stages should be sent. Fleshy or moist, watery material likely to become decayed or offensive while in transit should be packed as dry as possible. If the material is very perishable, dry completely, or preserve in alcohol, before sending.

Care in packing is important to make

CITRUS TREES

TRUE TO NAME

And embracing all the standard sorts, are to be had of our establishment. Bear in mind that we are the largest growers of Citrus Trees in the world, and that our stock has been awarded the gold medal at every world's fair in the world where we have shown. Our fine booklet, containing 50,000 words and over 100 illustrations, gives you all the points on Citrus Culture. Price 25 cents. Can we send you a copy?

Pollard Brothers **Alhambra, California**

identification easier. If the specimens consist of leaves, straighten them out between layers of newspaper. If they are stems or solid parts, wrap each in dry newspaper. Fruit likely to be crushed should be sent in small strong boxes. Do not pack moist. As a rule, specimens carry best if sent while fresh, without moistening the wrappings, while an excess of moisture causes mold and decay. Never lay wet cotton against specimens, as it sticks to them. In sending several fruits, wrap each separately in tissue paper.

The name of the plant and the place and date of collection should be written on a slip of paper and enclosed with each specimen. When the name of the diseased plant is not known, as in the case of wild species, send flowers or fruits from healthy plants to aid in identification. If the specimens sent are mentioned in your correspondence, number them and refer to them by number.

When material is sent by express, the cost of sending should be prepaid.

THE UNAPPRECIATED POMELO.

It is interesting to note that the Pomelo was either unknown to or disliked by horticultural writers, but a few years ago, or confounded with the Shaddock even up to very recent years. Alexander Watson in 1859 wrote the following: "Shaddock is a still larger fruit (than the citron,) in form more resembling the orange, curious, but worthless." W. N. White, in 1867 says: "Pulp dry, sweetish or subacid, but not very desirable, except for its showy appearance." Rev. T. W. Moore, in his Hand Book of Orange Culture, 1881, does not mention it. Thomas in his Fruit Culturist makes no reference to it up as late as the edition of 1885. William A. Spalding in 1885 makes the following remark: "Meanwhile the Pumalo and its congeners when allowed growing space continue to load themselves down with fruit as large as foot balls. They are matters of wonder and that is all." Charles Downing (1885,) under the head of Shaddock, has the following note: "The pulp is sweetish or subacid and the juice is rather refreshing. It is, however, more showy than useful, and certainly makes a magnificent appearance in a collection of tropical fruits."

CARE OF PRUNING SAWS.

With a little care saws may be kept almost as bright and clean as they are when purchased. After each time they are used they should be cleaned of all sawdust and wiped off with an oiled cloth to prevent rusting. Rust ruins a saw. Nothing is more aggravating than to have to use a dull saw or one with an insufficient amount of set. The pruner should see to it that his saw is well sharpened and that the teeth have sufficient set to clear the cut. For use in green wood more set is needed than for cutting seasoned wood. To give additional "clearance" in cutting some pruning saws are thicker along the teeth than they are along the back.

"Remember," said the melodramatic man, "there are things in this life that money cannot buy." "Yes," answered the impecunious person wearily, "but I had enough of them long ago. What I want now is a change."

Piles Cured In 6 To 14 Days.

RECIPROCAL DEMURRAGE.

From every important fruit growing section in the Union has gone forth the appeal to the railroads: "We want more cars." Each succeeding year the cry has been louder and more urgent until during the past few months it has developed into a demand to which the transportation companies dare no longer turn a deaf ear. In many fruit shipping centers, industrial paralysis has been the result and much of the shortage has been due to unjust discrimination. True it is, that with crops so abundant as to have no parallel in our country's history, the capacity of the railroads has been severely taxed, yet those who have fully informed themselves on the subject are very decided in the statement that the more powerful industries have been furnished with all needed rolling stock and that the unorganized and therefore unprotected fruit growers have been discriminated against, with most disastrous results.

The plea of the larger railroad companies that they lack cars, and locomotives to move them, will not suffice when we know that for years they have sucked the lifeblood out of the fruit industries of the Pacific Coast and have, through other like channels become so bloated with wealth that one man has been dubbed "Railroad King," and has at his command so many countless millions that he could buy the entire railroad mileage of the nation. Money they have in plenty and money will at all times buy cars or equip factories to build them, and one of the two they will do, for the people are no longer to be trifled with and are demanding their rights in no uncertain tone.

Up in Oregon at present the people have before their Legislature, three bills that seem destined to change the entire situation and bring about a just return to the people of those powers and priveleges guaranteed by the constitutions of the State and Nation. The Oregonians are asking their Assembly for: A reciprocal demurrage bill, a maximum rate bill, and a railroad commission, but the first heavily overshadows in importance the other two. It has been the invariable practise of the railroads to charge a demurrage of ten dollars per day for all time a car is held, either to load or unload, after the first twenty-four hours. It is now proposed to have the rule work both ways and after a demand is made for cars the railroads will be forced to pay the same amount per car each day after the first until the demand is met.

To California, more than to any other State in the Union such a law would prove an emancipation proclamation, for the fruit growing industry most assuredly represents the lifeblood of the commonwealth and the transportation vampires have sucked at it so persistently that at times our arteries and veins have been well nigh empty and our fruit growing body on the verge of collapse.

PANIC? NO.

Stuyvesant Fish, who was relieved of the presidency of the Illinois Central railroad recently, has been making some pessimistic prophesies about a panic to come in the near future. His observations are influenced, no doubt, by his personal feelings. He had a conflict it is said with Harriman, and lost out. He naturally feels morose and everything he looks at takes on a morbid hue.

He says, the country is going to see a wide-spread panic in 1908; that Wall street has gone crazy on stocks; that mining investments have depleted the common people and that money is going to be very dear. All these observations, it will be noticed, he makes since his abdication of a position, which paid him a very fat salary.

Now the truth is we have had several "panics" in the last year if we gauge monetary conditions by the rule that used to be laid down in the days of Jay Cooke. Several times the banks have ceased to loan money to speculators, even business men have suffered inconveniences in obtaining necessary funds to transact their affairs. Still there was no "panic."

Had we been in the condition we were in twenty years ago we might have had a genuine panic. But the difference is in this. The county has an agricultural basis today it did not possess then. There are many hundreds of millions of dollars in the hands of the people more than there were at the time Jay Cooke failed and created a general tie up of industrial interests. The farmers are all in good condition. They are, as a class, free from debt, they may be said to be independent.

Secretary Wilson says, the farmers of the United States are the richest class of agriculturists in the world. So long as this condition obtains there can not be any wide-spread panic to affect the country. Stock gamblers may go broke; we do not care if they do. Crazy real estate investors may be caught, but they might expect to be when they attempt to do business without capital. But these interests will not be sufficient to plunge the country into a disastrous financial era of loss. We may see a short period of hard times; we may have to curtail expenses; we may see a few trusting over-confident banks go down, but these will only be in localities; of country at large will be all right because the farmers are sound. Remember that. The farmers are independent, and the farmers are the backbone of the Nation.

In direct opposition to Stuyvesant Fish's views are those expressed by George Gould, the president of many railroads and a great continental road builder. He says:

"The business conditions of the country look very encouraging and the immense volume of business done by the railroads in 1906 will not only be equaled, in my judgment, but surpassed during the present year. There is no industrial crisis, and while the market has declined recently it is my belief that it is a temporary but healthful reaction."

Both men are speaking of the immediate future and as we see no signs of an immediate business breakdown we incline to take Mr. Gould's view and to say, that the outlook justifies the belief there will be no panic very soon.

Complete Irrigation Plants

Send us answers to the following questions, and we will furnish you preliminary estimate of the **cost of installation** and **cost of operation** of your plant.

1. Do you pump from bored well, river or ditch?
2. If from river or ditch give diagram showing elevation and character of soil.
3. If from bored wells state number and size of each and distance from centre to centre.
4. Have you a pit? Give size and depth.
5. How far from surface to water level?
6. Gallons per minute desired.
7. Has well been pumped? How much does the water lower?
8. Height above ground water is to be elevated.
9. Length of discharge pipe. State kind and size to be used.
10. What experience have you had with power?
11. Have you decided on pump; if so what make?
12. What part of the plant do you want us to contract for?
13. When do you want plant installed?
14. Do you want us to install plant? If not, who?

AGRICULTURE.

The rain at Rialto registered 1.07 inches, which makes 11.41 inches for the season.

The total for the big storm at Santa Paula was 8.82, making 15.70 for the season, against 1.70 for last season.

The rains have transformed the Santa Ana from a peaceful creek to a surging river, with an estimated flow of 30,000 inches.

The total amount of rainfall for the season at McPherson is 7.54 inches, which causes rejoicing amoung the farmers of that region.

Mr. Getty's rain gauge at Tustin, showed an even four inches of rainfall for the storm Saturday to Wednesday night, making 8.89 for the season.

There is being shipped from El Centro some twenty-five cans of cream each day for which the ranchers are credited about 800 pounds of butter fat.

A total of 12.53 inches for the season, and 3.25 for the past week is the dampness registered at Redlands. That looks like a 25 inch rainfall for this year.

The rainfall in Riverside for the present season, is now 8.52 inches, only .48 short of an even nine inches. The total for the present storm of this week was 1.64.

Wednesday Lake Hemet was 116 feet 3 inches deep. On the 7th an inch and a quarter of rain fell and on the 8th one and a half inches. Three inches of snow also fell this week.

E. E. Forrester, who lives about three miles west of El Centro, raised a sweet potato that weighed just 52 pounds. In size it was somewhat larger than a nail keg and was of fine grain.

According to the rain gauge, at Fullerton the rainfall from January 5 to January7, inclusive, was 3.40 inches, and the total rainfall for the season is 8.90 inches, more than double the amount that had fallen at this date last season.

The heavy bean crop of the vicinity of Oxnard was nearly all sold during October and November, only five carloads going out in December. They have now in the warehouse about 30,000 sacks, but they are also sold at prices ranging from $3.85 to $4.00

Farmers near Greeley, Colorado, raising beets for a large sugar factory near that point, have issued an ultimatum to the sugar trust, controlling the factory, that they will not raise sugar beets next year unless they secure a contract of a five dollar flat rate for their products.

Fred McIntyre, the cattle man of San Jacinto, reports that prospects in the valley are fine for cattle feed. New grass is coming on nicely and the beeves will soon begin to take on flesh at a rapid rate. The present cold weather he looks upon as a sure indicator of a warm spring with plenty of good range.

A protest was filed with the County Board of Supervisors yesterday by Attorney Ralph E. Swing, repesenting eighteen ranchers who do not want to be included in the proposed assessment district for the Redlands storm water ditch, application for the formation of which was made by several Mission ranchers some time ago.

The Addison Pump Company with offices and factory at Pomona, Cal., has recently secured the services of Joseph H. Cox as General Manager. Mr. Cox is a mechanical engineer of pronounced ability in the manufacture and operation of first-class machinery, is a tireless worker and has a good clean business record. Many changes are being made in the factory whereby the pumps can be manufactured more rapidly and at a reduced cost. The company has just completed a fine deep-well pumping plant for Mr. George Woodbury of Pasadena, and for Colonel Robert Northam near Monrovia, and are now installing one of their largest deep-well pumps for Adolphus Busch and a smaller one for Mr. R. R. Blacker, both plants in Pasadena. They have several other contracts for pumps to be installed as soon as wells are ready.

HORTICULTURE.

No small amount of native lumber from the San Jacinto mountains goes into boxes in which are packed the orange and lemon crops of Southern California.

The Oasis Orange Company has filed articles of incorporation in the county clerk's office at Riverside. The principal place of business is Riverside, and the capital stock is $81,000, fully subscribed.

E. K. Carns, of the state horticultural commission is conducting experiments in the citrus orchards at San Deigo, with the bug recently found in China, which is believed will prove a parasite for the red and purple scale.

In spite of the almost incessant rain the past week, thirteen cars of oranges were shipped from the Santa Fe depot in Orange. This makes a total of 1,825 cars of oranges and 432 cars of lemons sent East from Southern California this season.

The Southern Pacific, Santa Fe and Salt Lake railroads will make a fare of one and one-third for round trip tickets to the Citrus Institute to be held in Riverside, January 22 to 24. This rate will be good from all points south of Santa Barbara.

Last week was a very quiet one in Riverside for orange shipping, only 60 cars being sent out, and in view of the heavy rain with which this week opens, picking will be light this week. It looks now as if it would be the first of February before the present season got fully under way.

On the 10th of June, W. S. Corwin picked from his vineyard near Imperial, some of the finest grapes known. On the 10th of January Mr. Corwin picked from the same vineyard several boxes of the fine Emperor grapes. During those seven months there was never a day but the vineyard produced ripe grapes, there being four distinct crops.

Citrus Growers' Institute

Following is the program for the Citrus Institute that will be held in Riverside on Jan. 22, 23and24:

Tuesday, Jan. 22.

1:30 p. m.: Introductory—J. H. Reed, Riverside; E. J. Wickson, Berkeley.

2:00.: p. m.: Too what features of orchard management and after management of fruit do you attribute success most largely?—C. C. Chapman, Fullerton; H. H. Garstin. Redlands.

3:00 p. m.: Orchard and handling methods necessary to success with lemons— C. C. Teague, Santa Paula; R. C. Allen, Bonita.

7:00 p. m.: Music.

The practical value of scientific work as illustrated by the commercial results from G. Harold Powell's investigation—B. A. Woodford, Los Angeles, manager of the California Fruit Growers' Exchange.

Relation of the University to the new Citrus Experiment Station—Pres. Benj. Ide Wheeler, Berkeley.

Wednesday, Jan. 23.

9:30 a. m.: Question box—Director J. B. Neff. (Question to be on addresses and discussion of previous afternoon and evening.)

10:00: Discussion, If yet ascertained, what are the specific requirements for securing a larger proportion of finest fruit? Led by C. E. Rumsey, Riverside.

11:00: The important and urgent practical problems to the solution of which the Citrus Experiment Station should give early attention.—C. W. Lefflingwell, Whittier; Prof. A. J. Cook, Pomona College; discussion opened by Prof. C. R. Paine, Crafton.

1:30 p. m.: Music.

Question Box—J. B. Neff. (On mattors already discussed.)

2:00 p. m. : Further discussion on investigation needed to be taken up by the Experiment Station. Lead by F. J. Palmer, Pomona; Prof. C. B. Sumner.

3.00: Proposed Experiment Station work.—Prof. Ralph E. Smith, director of the Citrus Experiment Station; E. J. Wickson, director of College of Agriculture.

7:30 p. m.: Music.

Possibilities of improvement of citrus fruits.—E. J. Wickson.

Address, "People's Lobby." — Benj. Ide Wheeler.

Thursday, Jan. 24.

Morning: Ride to Experiment Station grounds.

1:30 p. m.: Question box.—J. B. Neff. (On matters discussed Wednesday.)

2.00: Some of the definite methods of fertilizing fruiting orchards successfully, now well determined in practice.—W. J. Barth, Corona; discussion opened by Jas. Mills, Riverside.

3:00: What definite practical progress has been made in controlling orchard insect pests?—W. J. Jeffrey, Horticultural Commissioner, Los Angeles county; discussion opened by R. P. Cundiff; Horticultural Commissioner, Riverside.

Evening: Address — Ex-Governor Geo. C. Pardee.

Northern California

HORTICULTURE.

Petaluma was visited by a genuine snow storm Sunday.

The gigantic plant which the California Wine Association is erecting at White Haven, near Pt. Richmond, involving millions of dollars, will undoubtedly have a beneficial effect upon the industry throughout the state.

Special days have been set apart by the Cloverdale Citrus Fair association for the fourteenth annual exhibit of fruits in February. The exhibition will open on Tuesday evening, February 19, and the day following. Wednerday, will be known as Cloverdale day.

Yuba county has adopted an ordinance prohibiting the importation into the county of any grape-vines or roots unless a certificate has first been secured from the state commissioner of horticulture showing that phylloxera, anaheim or mysterious vine disease has not existed in the county in which such vines or roots were propagated for the period of five years preceding shipment.

The heavest snow that ever fell in Orland is now on the ground. At 8 o'clock Monday morning the snow registered nine inches on the level, and was still falling at the rate of one-half inch an hour. The owners of the principal orange groves were out early with large crews of men shaking the snow from their trees. In a great many instances the limbs of the trees are broken, causing considerable loss to the owners.

Winehaven is the name of a new town that is to be established on the shores of San Francisco bay, near Point San Pablo, in the near future. This town will be peopled by the employees of the California Wine Association, which at present has under consstuction one of the largest wine making plants in the United States.

In some districts of Northern California, a few oranges were damaged, but as a rule the crops had all been picked before the big storm came.

AGRICULTURE.

Woodland had three inches of snow and Red Bluff eight inches during the last big storm.

John Russell brought to Hanford Monday 190 hogs that averaged 200 pounds each. The hogs are worth $6.90 per cwt.

A pasteurizing plant will be put in at Lemoore by the Maple Grove Creamery, and the plant will be in operation sometime this month.

J. B. Stewart, tobacco expert of the United States Department of Agriculture, is in Sacramento for the purpose of investigating the tobacco possibilities of this state.

The auction sale of Snorthorns at Woodland last mounth was so satisfactory that the promoters announce one for next fall, to take place on November 12, 1907.

The west side farmers in Fresno county, particularly around Jamison, are again appealing to the Board of Supervisors for something to be done to prevent the overflowing of Fish slough.

In Siskiyou county the snow is unusually deep. At Sisson there was four feet and at Dunsmuir one foot. All along the road from Dunsmuir north the telephone and telegraph lines have been out of commission.

Ninty pounds of tomatoes to a vine is a common thing about Fair Oaks, but many tons of this fine product went to waste last season on account of the long haul to market being too expensive an item in their distribution.

Bulletin 181, issued by the Department of Agriculture at the University of California, will prove interesting reading to those of our subscribers who live on the farm, and especially those who are engaged in growing wheat.

Mr. E. Brecht, an experienced German agriculturist who has been growing sugar beets for the past four or five years, has transferred his field of operation to Tulare County, and will grow 500 acres of the saccharine-producing roots.

Saturday, February 2, is the date set for the meeting of the Tehama County Stock Grower's association. This is to be a very lively and interesting meeting, and all the members of the association, beside the stockmen of the entire county, will be present.

Fair Oaks is fast becoming famed as one of the most productive agricultural communities of the state, and here diversified farming is carried on on an extensive scale. Beside other crops, the new colony is rapidly becoming known as the home of the melon.

The Sonoma County Co-operative Poultrymen's association has secured what is considered a fine contract for their eggs during the year 1907, awarded to Swift and Company of San Francisco. It is based on exchange quotations, net, in Santa Rosa, with a 20-cent minimum.

The Yuba county supervisors have adopted a resolution requesting that a soil survey be made by the United States Government similar to that being made in other parts of the state. The county clerk has been directed to formulate a copy of the resolutions to the Secretary of Agriculture.

As a result of the heavy rainstorm which has been raging for the past four or five days, the town of Coalinga has been inunated and the people of the Oil City forced to flee from their homes and pitch their tents on the outskirts of the town. The streets of the city lie under two feet of water.

In response to an appeal made by Gov. Pardee for a more speedy accomplishment of the soil surveys of the Sacramento and San Joaquin valleys, the United States Department of Agriculture has recommended that the state and national governments cooperate and that an appropriation of $45.000 be made immediately, with which the work can be completed within the course of two years.

You can positively make hens lay the year around if you will give Dr. Hess Poultry Pan-a-ce-a with the regular feed. During this season of the year many valuable layers are idle. In other words, the egg factories are closed down on account of impaired machinery. Poultry Pan-a-ce-a contains the best tonics known to medicine for increasing digestion, which is the all important function in egg production. This superior poultry tonic supplies iron for the blood, cleanses the liver, arouses the egg producing organs, reddens the comb and brightens the feathers.

DR. HESS Poultry PAN-A-CE-A

Is the prescription of Dr. Hess (M.D., D.V.S.), and in addition to increasing egg production, it cures cholera roup, indigestion and many other poultry diseases due to digestive difficulties and infection. It has a property peculiar to itself—that of destroying bacteria, the cause of so much poultry disease, and throwing off impurities through the skin. Dr. Hess Poultry Pan-a-ce-a has the indorsement of leading poultry associations in the United States and Canada, costs but a penny a day for about 30 fowls, and is **sold on a written guarantee.**

Two Notable Poultry Shows

THE second annual show of the Poultry Breeders' Society of Southern California was pulled off at Chutes Park, the first week in January. It was a crowing success in every particular, and left the treasurer about $500 to the good. The entry was large, the quality was high, the exhibitors, as a rule, were pleased with the awards. In fact the show was a credit to Southern California. Good shows are a sure indication of the prosperity of the poultry business, for the fancy form the backbone of the poultry industry.

The show was well cooped, and Superintendent Andrews is to be congratulated for the able manner in which he handled the birds.

There were more silver cups offered at this show than had ever previously been offered at any show held in Southern California, which stimulated and helped to make it a success. Where so many special premiums are offered, competition is naturally very strong, and in this show everyone expected to see strong competition; but a great many surprises were in store when birds began to arrive that had won prizes all over the world. As the judging proceeded, much interest was manifest, for there was a battle-royal in many classes.

The managers of the Breeders Society are all fanciers of the "purest ray serene." and gave much thought and hard work to the details of the show, looking after the exhibits and extending courtesies to the visitors.

The largest exhibitor was the Holmby Poultry Farm of Hollywood, Mr. Arthur Letts, proprietor, and Mr. Purdy manager. We understand there were between 250 and 300 birds in this exhibit, and it was the largest exhibit ever made by a single exhibitor in Southern California. In the exhibit were Orpingtons that had won at the largest show in England, recently imported by Mr. Letts. It also contained the finest string of Black Orpingtons ever shown in the United States. Mr. Letts was also strong in Buff, Jubilee and White, winning many rich prizes, including a "baker's dozen" silver loving cups. The exhibit also contained some fine water fowl and turkeys.

Mrs. Rhoda E. Durfee of Santa Ana, came up with a strong line of White Plymouth Rocks, and was successful in winning her share of prizes.

Some of the Winners.

Following we give a list of the winnig of the principle exhibitions, as nearly correct as we were able to obtain them:

BARRED PLYMOUTH ROCKS—Fred Espe, Los Angeles, 1st cock, 1st, 2d, 4th, and 5th cockerel, 2d & 3d pullet 1st, 2d, & 4th pen.

WHITE WYANDOTTES.—White Wyandotte Farm Inglewood, Cal., 1st, & 2d, cock; 1st, & 2d, cockerel; 1st, & 2d, pullet; 1st, & 3d, hen; 1st, & 3d, pen. Mary Van Brunt, Hollywood, 2d pen and silver cup. Willard Poultry Farm, Hynes, 3d cock. C. L. Berky, Fullerton, 2d, 4th, & 5th hen, 3d cockerel, 3d pullet, 4th pen.

BUFF WYANDOTTES.—L. E. Berky, 3d, 4th, & 5th cock. C. S. Hoffman, San Jacinto, 1st & 2d cock, 1st, 3d, & 4th cockerel, 2d & 3d, pullet, 3d & 5th pen, special for best colored male, special for best shaped male, cup for best display.

PARTRIDGE WYANDOTTES.— L. E. Berky, 1st, 3d, 4th, & 5th cock; 1st & 2d hen 1st cockerel 4th & 5th pullet, 1st & 4th pen, cup for best display. C. Andrews, Hollywood, 2d 3d & 4th cockerel, 1st 2d & 3d pullet, 2d & 5th cock, 3d hen, 2d & 3d pen.

COLUMBIAN WYANDOTTES.— Ed. M. Burnell, South Pasadena, 2d 3d & 5th cock, 1st 2d & 5th hen, 2d 4th & 5th cockerel, 1st 3d 4th pullet, 2d pen, cup for best male and female, five special ribbons. Frank J. Ironmonger, Hollywood, 1st cock, 3d cockerel, 4th pullet, 4th pen.

RHODE ISLAND REDS.— Frank Greenleaf, Santa Ana 1st pen, 1st hen, 2d & 3d cock, 3d pullet, 4th pen. Goodacre Bros., Compton 5th cockerel,

BUFF ORPINGTON.— P. L. Harley Redlands, 2d cockerel, 3d hen, cup for the best female. Ross & Tate Altadena, 4th cockerel, 3d pen. Goodacre Bros. Compton, 5th cock, 5th pen.

BLACK ORPINGTONS.— Ross & Tate, Altadena, 4th cockerel. P. L. Harley, Redlands, 2d cock, 5th cockerel, 3d pullet, 4th & 5th pen.

WHITE ORPINGTON.—P. L. Harley, Redlands, 1st cockerel, 1st & 2d hen, 3d & 5th pullet, cup for best pen Ross and Tate, Altadena, 4th cockerel 2d pullet, 3d pen.

ROSE COMB WHITE ORPINGTON. —Goodacre Bros., 1st & 2d hen, 1st cockerel, 1st pen.

BLACK MINORCAS.—Perham and Wheeler , Lordsburg Cal. 1st & 3d cock, 1st 2d & 3d cockerel, 1st 2d 3d 4th & 5th hens, 1st 2d 3d 4th & 5th pullets 1st, 2d, pen, cup for best male in show and President's cup for best display.

WHITE-FACED BLACK SPANISH.—Mrs. O'Connor, Dolgeville, all awards.

BLACK-TAILED JAPANESE BANTAMS.—LeRoy Burrell, South Pasadena, 1st cock, 3d 4th hen, 1st 2d cockerel, 1st 2d 3d & 4th pullets 1st 2d pen and 3 cups. J. Lynn Ironmonger, Hollywood, 2 cock, 1-2 hen

GOLDEN SEABRIGHT BANTAM— C. Andrews, Hollywood, 1st cock, 1st hen.

PEKIN DUCKS.— Goodacre Bros., 3d young drake 1 st young duck cup for best pair.

BUFF ORPINGTON DUCKS.— Goodacre Bros, 1st drake, 1-2 duck.

COUNTY SHOW.

The Eighteenth Annual Exhibit of the Los Angeles County Poultry Association has passed into history, and in spite of the unfavorable weather, proved a success; and we understand that although the expense was enormous the show payed out.

The Panorama Building where the show was held, was the best place for a show on the coast, and was by far the largest hall in the city.

We are sorry that space will not permit us to go into a detailed description of the various breeds and varieties. Besides the extra large show of the better known varieties, there was a large display of Bantams—perhaps the largest ever shown on the coast. There were also about 500 pigeons of every known variety and a fine display of Pheasant, Pea Fowl, native Jungle Fowl, Ostrich and Turkey. Taken as a whole, it was the largest variety of fowls ever exhibited at a

poultry show either east or west.

Following we give a condensed report of each judge on the varieties he judged:

Judge Hogue.

The Black Langshans were a good class, and there were some extra fine pullets and hens. The White Minorcas were good. The Buff Wyandottes were one of the three larger classes of the show; they were a magnificent class all through. The first prize cock was perhaps the finest shaped Wyandotte that was ever shown in California. Judges Barrar and Browning gave him the medal for being the best-shaped Wyandotte in the class. The Silver Laced Wyandottes were a small class but exceedingly fine. Black Hamburgs were good. The Pit Games were a large class with some wonderful specimens. The Golden Wyandotte was a nice class with many choice specimens, especially the first prize pen. The Partridge Cochins were good, and pronounced by Judge Barrar as the best he had seen for years. The White Crested White Polish Bantam was one of the features of the show, and contained many good specimens. As a whole I was much pleased with the classes I handled.

Judge Barrar of San Jose.

All the classes I handled were very good in every way, the competition was very strong, and anyone who got into the winnings was very fortunate. The Silver Sebright Bantams were no doubt the best ever shown on the coast, and I doubt if any better were ever shown in the United States. In-so-far as the show generally is concerned, it is safe to say that no larger or better class of birds has ever been shown west of the Mississippi River. I judged the hens and cocks in the Barred Plymouth Rock breeding pens; cockerels and pullets in the White Plymouth Rocks; all the Black Minorcas, rose and single comb; all the White-Faced Black Spanish, which is the largest and best class ever shown on the coast for many years. I also judged the Black Orpington cocks and hens, Jubilee Orpingtons and Silver Sebright Bantams and the Red Pyle Game Bantams. The Polish display is an attractive feature of the show, being represented by a good class of Black and Bearded Golden Polish. The Black Orpington was certainly the finest ever shown on the coast, and we think equal to any ever shown in the United States, if not superior. I think the first prize Black Orpington cockerel is the finest Black Orpington male in the world today.

Judge Browning of Ogden.

The first prize pen of Barred Plymouth Rocks were exceptionally well matched in color, also fine in shape a grand all around pen excepting the male bird, which is a little under size. The second and other pens were fine, and they necessarily had to be, to win in such a large class, as this is probably the largest class in the show. The first prize cockerel was an outstanding winner in his class, and one of the best male Rocks ever shown in the west. The second prize cockerel is also a grand bird both in color and shape, but was slightly under size. The other winning birds are good specimens of the Barred Rock breed. In pullets the first and second were also what might be called a class of their own; they are fine specimens of an up-to-date Plymouth Rock. The owner had over fed and got them too fat, otherwise there was very little to criticise in these two birds. The third and fourth pullets are grand pullets of an

1907 Model

The Stockton Incubator

Is now manufactured under new management and is in every way put up as a first-class machine. Our 1907 model is a perfect working incubator, low in price, economical to run and gives a fine hatch.
Winner of silver medal at Pan-American, also medal at California State Fair. Write for circular and information.

Stockton Incubator Company
G. S. Marshall, Prop. Stockton, Cal.

up-to-date style. The fifth prize pullet is one of the clearest barred birds of the old style of wide barring that could be found anywhere, but the barring of today is more narrow than what was called for some five years ago.

In White Plymouth Rock Cocks the first prize bird is the finest White Plymouth Rock cock that I ever handled, and was in a class by himself. The other winning cocks were all grand specimens and fully up-to-date, but when considered in every section none of them equal the first prize bird. The hens were all very typical and an exceedingly fine lot.

The White Wyandotte pens were all very fine specimens of the Wyandotte shape, and very little defective color was to be found. They were such a strong class that some pens left out of the winnings would have taken first prize at most shows. There was very little choice between these pens. The cock birds were an exceedingly strong class and at least one noted Chicago winner was unplaced in this class, so hot was the competition. The hens were of the same quality as the cocks, with very little to choose between the winners.

White Crested Black Polish were one of the strongest classes ever exhibited west of this breed, and were very attractive and an excellent lot. They all had exceptionally fine color.

The Buff Orpingtons were one of the strongest classes of the show, and I was surprised to find such fine color. Clear wings seemed to be a common thing with these fowls, and very little black in the tails of the winning birds. The winning pullets and cockerels were all very fine color.

Blue Andalusians. This was rather a weak class.

Golden Sebright Bantams. Some of the most beautiful feathers ever carried by chicks were found among the Golden Silver Sebright Bantams of this show. They were a grand miniature specimen of Sebrights.

S. Tyler, Pasadena.

I have never seen a better display in any show room, quality and quantity considered, the American classes being very strong. Take it all in all the show is very fine, the Bantam class being the largest I have ever seen on the coast and exceptional in quality .

Judge Randall.

Buff Orpingtons were a strong class, particularly the cocks and pullets; hens had some good old campaigners among them, and was as a rule good.

Black Orpingtons were also a strong class, and the winning cockerel was a beauty. His long journey from England did not affect him in the least. The second bird was a little out of condition, and was evidently suffering from too much show. The third was a fine list. Black pullets were very fine, being some of the best that it has ever been my lot to see. Hens were a medium grade, and mostly out of condition. The long confinement being too much for such heavy birds.

White Orpingtons showed a decided improvement on last year's exhibition. The winning cockerel, pullet and hen being particularly fine.

Dorkings were a small class, but good in quality, one pullet being a dream.

Partridge Cochins were good, the winning pen being the best we have ever seen on the coast.

Buff Cochins were weak, and would not be recognized in some parts of the country.

Anconas were a fair class.

Buff Cochins Bantams were a strong class, and competition very keen. The winning cock, hen and pullet were a revelation to western Cochin men. No such color has been seen here before.

Silver Spangled Hamburgs were a small class, but high in quality. The cock was a dandy, as also was the leading pullet.

F. H. Thomas.

The classes I judged were the finest in quality I have ever handled. The Buff Rock was by far the best I have seen since I came West. They were a good even buff color, and well up in size and shape. The Buff Wyandotte class was also good. The first prize cockerel was of a very even color and a typical Wyandotte. As a whole the class was much better than last year. The Partridge and Columbian Wyandotte, although not such a large class as some of the others, showed good. The Single-Comb Buff Leghorn was a large class, consisting of some very choice birds. The Polish classes in the Goldens and the Silvers contained some of the finest birds that could be brought from the best yards in the East, and were a pleasure to handle. Altogether the Polish class is as strong as could be found in most any show in this country, either East or West. The Black Red Game Bantams is a class that is worthy of mention, as the birds were very hard, fine station, and would prove winners not only in the west but in the east. As a whole the Los Angeles County Poultry Association can congratulate themselves, that they have "pulled off" the largest and best show that was ever held on the coast; that the quality of the birds exceeds that of previous years, also that the show was well staged and well managed.

NATIONAL POULTRY ORGANIZATION.

A circular letter is being sent out to the poultry departments of the various State Experiment Stations suggesting the organization of the instructors and investigators in poultry husbandry. As the letter well states, the field of poultry husbandry is a comparatively new one, and much can be gained by those engaged in the work holding an annual meeting to exchange views and experiences. It is suggested that the meetings be held at some event of special interest to poultrymen, like some leading show. Prof. James E. Rice, of Cornell, is the prime mover in the proposed organization.

FLUTE CORN.

An Englishman and his wife sat near me in a cafe on the avenue the day before yesterday. I knew they were English as soon as I saw his coat and her hair. Even if I had been these two unmistakably English things, I should have guessed their nationality from a name they gave to an American dish. The man was ordering luncheon.

"I don't see it on the bill of fare," he said to the waiter, "but bring me some flute corn if you have it."

"Flute corn?" repeated the waiter, in surprise.

"Yes," said the Englishman, "flute corn."

The waiter still hesitated.

"Why," went on the Englishman, don't you have it?" The sort of corn you know, that one eats like playing the flute."

And as a delicate euphemism for corn on the cob I think "flute corn" can hardly be surpassed.

The Ornamental Garden

By ERNEST BRAUNTON

Rose History

THE ROSE has for all ages been the favorite flower, and as such it has a place in general literature that no other plant can rival. The number of species of roses (not varieties) is differently stated as from thirty to over one hundred, while the number of varieties catalogued by specialists in Europe and this country has long overstepped the thousand mark.

This great number of species and varieties of roses illustrates forcibly the extreme variability of the plants, their adaptability to various conditions and consequently their wide dispersion over the globe, the facility with which they are cultivated and the readiness which new varieties are continually being produced by the art of the hybridizer and the careful selection of seedlings. The species are natives of all parts of the Northern Hemisphere, but are scantily represented in the tropics, except at a considerable elevation.

The original rose was a single, five-petaled flower, and is only represented among the cultivated species by the Japanese Rosa rugosa. Roses have been grown for so many centuries and have been crossed and recrossed so often that it is difficult to refer the cultivated forms to their wild prototypes. It is generally believed that the older roses in cultivation originated from Rosa gallica, a native of central and southern Europe. Rosa centifolia, the cabbage rose of the Caucasus, contributed its share, and a cross between the two may have been the origin of the Bourbon rose.

The monthly or China roses sprang from Rosa indica, and these crossed with the centifolia and gallica types, are the source of the hybrid perpetuals. Tea roses and noisettes also acknowledge Rosa indica as one of the progenitors. The Banksia rose is a Chinese climber. Rosa Damascena is cultivated in some parts of Turkey for the purpose of making attar of roses, The flowers are gathered before sunrise and distilled the same day. The distilled liquid is allowed to remain for a day or two, by which time most of the oil has risen to the surface, from which it is skimmed off. It takes 200,000 roses to yield an ounce of attar, and the quantity sells on the spot for about $1000.

ANGEL CITY NOTES.

An eupatorium, known here specifically as arboreum, is now in full bloom and will so continue until May. The umbels are loose and as much as a foot in diameter. If given room to develop the plant grows to a large size. The stems, of an inch or two in diameter, are as hard as those of any other shrub.

Sweet alyssum is a perennial here, and if kept sheared close soon after the blossoms begin to be on the decline, may be had in bloom every day of the year.

Bigonia venusta, just now coming into flower, is one of our most attractive winter-flowering plants. It is surprising how low a temperature it will endure and do well. This entire family of plants is one of the most valuable we grow in Southern California. B. venusta is followed in early spring by B. sideriafolia, with its larger creamy white flowers in great profusion. This variety is succeeded by B. buccinatoria, with its large bright red blossoms with a yellow throat. At the same time the deciduous varieties are in their glory.

Japan persimmons are so well adapted to California climatic conditions that they will soon be one of our staple products for home consumption. They are too soft for shipment, therefore will not appear in Eastern markets. Wherever they will stand the climate they should be largely planted. Some varieties produce fruit to a pound weight, and that too without a seed.

The beauty of Solanum Rautonnetii must be seen to be appreciated. Shrubby in habit, it is one of the most desirable subjects we grow on this coast. The flowers are of an intense violet blue, with a centre of gold.

Fatsia papyrifera is now in full bloom for the second time this season —an unusual thing for this sub-tropical plant.—P. D. Barnhart.

DIVIDING PERENNIALS

Herbaceous perennials, which have grown for many years undisturbed, can best be dug up, divided and replanted during early fall, provided they have already flowered. While early spring is also an excellent time to perform this work, the plants will not flower as profusely the first season as those planted in autumn. Fall set plants become established before freezing weather, and if given a mulch during the winter, they start into rapid growth early in the following spring, flowering a week or so later than the old-established clumps.

Carefully dig up the plants to be replanted, and with a sharp knife or spade divide them into as many parts as there are crowns or shoots, leaving each with a portion of root. The new beds into which the plants are to be set should be in readiness for their reception before the clumps are divided, so that the plants will not be exposed to the sun or wind to dry out their roots. Perennials remain in the same location for years without being disturbed, and to have them healthy a well-prepared, fertile soil should be provided. Nearly all the species and varieties of herbaceous perennials can be most advantageously planted now, and so those desiring to embellish the home grounds with these plants should purchase and plant at an early date.

The numerous sorts, differing greatly in size, habit of growth and color of flowers, make it possible for one by a judicious selection to have a continuous display of flowers from early spring to late in fall. Herbaceous perennials are rapidly taking the place of bedding plants, because of their cheapness, perpetuity and effective display for a minimum amount of attention.

The newly fledged yatchtsman shouted to an officer of a certain craft:

"Have you weighed anchor?"

"Yes, sir."

"Then,' thundered the new commodore, "why the deuce don't you announce the weight?"

Gladys—Oh! Fred, I've been to see the doctor, and he says I can't play golf.

Fred (a rude unfeeling husband)—Indeed? But you might have saved his fee.

20 Reasons

WHY THE

Addison Pump

Is Better Than All Others

1. It will pump more water with less power.
2. It is more substantially constructed.
3. Has no overhanging bearings to spring and cause friction.
4. Absolutely uniform—does not break rods.
5. Plunger leather can be changed with less trouble and expense.
6. Water discharge in continuous stream—no pulsations.
7. Noiseless in operation.
8. Has no jar or hammer.
9. Perfectly balanced, no braces are required to keep pump in position.
10. Will be in good working order when other pumps with erratic or variable motion are in the scrap pile.
11. The frame contains within itself the main bearings, which are unusually large.
12. The cranks consist of three gearwheels, pinned on opposite sides, thus forming a double crank.
13. The outside gears are shrouded on the inside and the center gear on both sides. The pinions are placed on two counter-shafts in main frame in such a manner that the shrouds of the gears rest on the shrouds of the pinions, forming a bearing to carry the load when pumping, and thus keeping the teeth in proper mesh, giving the greatest strength and least wear and distributing the weight over six boxes.
14. The pitman rods are of the same length and are forged from one solid piece of best machine steel.
15. The driving and counter-shafts have only 22 inches between the bearings which carry the load, and with the size of shaft used makes it impossible to swing out of line, under the heaviest of work.
16. The cross-heads are planed and fitted with tempered brass strips made to fit groves in columns; so arranged that wear can be taken up.
17. Both pump rods are fastened to the cross-head pins, so there is no pulling strain on the cross-head proper.
18. By our specially constructed couplings, rods are as strong at joints as at any other part.
19. The Addison Patent Straight-Waterway Valves offer a free passage for water, causing less friction than in any other valve.
20. Pump can be operated without a stop as the following testimonial proves:

Addison Pump Co.,
Pomona, Cal.

Gentlemen:—

In reply to your inquiry of Dec. 24th., I am glad to say that your pump has now worked steadily for over two years with entire satisfaction.

As far as I can recall it has never had to be repaired, and has never missed a stroke.

Very truly,
J. H. McBRIDE.

Pasadena, Cal., Dec. 28, 1906.

If you will come to Pomona and spend a day with us we will show you our pump and other pumps in operation, then leave it to your own judgment to select the best.

We give an iron clad guarantee with every plant.

IT WILL PAY YOU TO INVESTIGATE THE ADDISON BEFORE PURCHASING A PUMP.

The two men who had entered the car seemed to want to occupy seats together.

"Can't you sit over a little?" they asked, stopping in front of a pale, scholarly man with eye-glasses.

"I do not know," he said, looking at them over his glasses; "but I will move over a little and see."

California Horticulturally

By JOHN ISAAC, Sacramento, California

Proposed Agricultural Legislation

THE LEGISLATURE is once more assembled in biennial session and as usual there will be many measures before it in which the farmer and fruit growers are directly interested. Among these, we understand, the University will have some measures looking to the establishment of other Agricultural schools than the one at Davisville. The princely gift of the late M. Theodore Kearney at Fresno can not be ignored, and the people of that county demand that it be used for a college of agriculture, following this, other sections come in with the claim that they too are entitled to recognition. Whatever notice is taken of the claims of the different sections, it will be necessary for the Legislature to make liberal appropriations both for the Davisville farm and the Kearney bequest, for possessing these properties, it becomes necessary to use them and to this end buildings and equipments are needed. Several measures of interest to the fruit growers are also rumored, among them the most important will be an endeavor to modify the County Commission act so as allow the local inspectors to get a living salary. When the present law was passed $2.50 per day was a fair compensation, but this amount is so absurdly small that it is impossible to get competent men to work for it. Other changes in the Horticultural laws, looking to their increased efficiency are proposed, but inasmuch as the coming legislature is as yet an unknown quantity it is difficult to fortell what will be done for the producers.

THE WHITE FLY.

There is a strong effort making on the part of some orange growers of Tulare county to secure sour orange stock from Florida under the impression that such stock is immune from gum disease. This is not the case, as the sour stock is as susceptible to the disease as is the sweet stock, but even were it true, the danger to be apprehended of introducing the white fly, which is proving such a terrible pest to the orange growers of Florida would more than offset any advantages such stock might offer. The white fly, Aleyrodes Citri, is vastly more elusive and difficult to handle than any of our scale insects, from the fact that in its mature state both sexes have wings and can escape treatment which can be applied to the scale tribe. They are very lively and can fly great distances and hence will spread over a wider area in the same time than scales can. In view of the fact that the purple scale, the worst of our present scale pests, was brought to us on Florida stock, it is well to make the strongest measures to keep out the worse pest of the white fly from the same State.

GROW OUR NURSERY STOCK.

It seems strange that, with all our superior facilities for growing nursery stock, that we, year after year, import such enormous quantities from the East and Europe. The greater part of the peach stock now being planted in this State is brought from Eastern States. The planter pays for his stock and the added cost of handling and freight, and at the same time takes chances of introducing with it one of many destructive diseases which a prevalent in the Eastern peach s tions. We see no reason why all t peach and, in fact, all other sto required here, should not be produc in our own State and produced fro good seed, which would guarant healthy trees when grown. A ve large percentage of the grafting sto used by our nurserymen is import from France and pays for packin ocean and railroad freight half-roun the world, customs duties and othe expenses which must add greatly first cost, and should be enough warrant its profitable production home. What is needed is home-grow stock; grown from hardy parent from good seed immune or resistan to many of our tree diseases, and wit such stock we should have less troubl with diseases in our trees when grow and could handle such diseases mor easily.

TOO MUCH.

Northern California is getting to much rain and the farmers are look ing anxiously for blue sky and goo plowing weather. The precipitatio this season has so far been unusuall heavy and the periods between storm altogether too short to get much wor done in the fields, as a result plowin is very much behind and unless goo weather comes soon it will be lat before seeding is finished.

PRUNES STILL IN FAVOR.

In spite of doleful prediction as t the future of the fruit industry in ou State, there is more orchard planting going on this season than ever before and while peaches take the lead, prunes come close in favor, and thi in spite of the fact that prune grower have had a hard time of it for years past, both in regard to crops and markets. This season, however, prices are encouraging and prune planting has responded to the improvement in the market.

CITRUS TREES IN MARLY SUBSOILS.

(Continued from page 51.)

marly ridges or belts. Among these will doubtless be the Lupins, which are very prevalent in the foothill and plains region of Fresno and Merced. Lupins require about one-half of 1 per cent. of lime, and some will resist as much as 2 per cent.; but marly soils such as those referred to above will certainly not bear any native Lupins. I doubt that even the gray sage will grow on land thus heavily impregnated. That, however, is a question of fact which those living on the spot should readily determine. If any such will send samples of the plants naturally growing on such lands to the Station, they would aid in the settlement of these questions.

IT'S PENNY WISE.

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 2124 Willow St., Los Angeles.

The Horticulture Quarantine Law of California prohibits the introduction of peach trees from any district where the diseases Peach Yellow and Peach Rosette are known to exist.

Queries and Replies

Vineyard Practice.

I have a five acre vineyard of Thompson's Seedless grapes that I would like information on in regard to pruning, as the vines are 10 feet apart and next to a vineyard of Muscats. The idea of long pruning would make it inconvenient to cultivate the same, as the Muscats and staking them up would be expensive. What I would like to know, is if it is necessary to stake up and prune long or whether they would not bear profitable pruned the same as the Muscats.

I would also like to know the formula for preventing curl leaf on peach trees, and the proper time to apply. Would you kindly tell me through your paper, also the amount of seed per acre each of Vetch, burr clover and field peas that is required for cover crops. J. D. H., Bostonia.

Thompson Seedless grapes do better pruned long and tied up to a stake, than they do when pruned short like a Muscat. When tied to a wire trellis they bear still better. Growers in the Sacramento Valley claim that the vines will more than pay for the wire the first year after coming into bearing.

Bordeaux Mixture is the thing to head off curl leaf. Spray with it as soon as you finish pruning. The later in the season before the trees leaf out the better, but in practice, we some times get left on account of the wet weather, and we therefore advise you to spray anytime when you get a chance after pruning.

Sixty pounds of peas and forty pounds of vetch are the amounts per acre to sow for green crop. We cannot say to a certainty how much burr clover to sow, but we would not sow more than twenty pounds. Let some of it go to seed under the trees and you will always have an abundance without sowing it annually.—J. W. M.

Crandalls Blackberry.

Will you please tell me where I can get Crandall's Early Blackberry plants and when to plant them? Subscriber.

Nurserymen advertising in this paper have Crandall's Early blackberries for sale. Plant them now.

Concord Grapes.

Having read your paper for the past 12 years, and been greatly interested in many of its articles,I wish to find out where I can get genuine Concord grape cuttings well rooted. Will you please answer in your next issue, in your column of queries and replies. —Subscriber, Orange.

We have no way of learning where such stock is for sale beyond that available to the enquirer. We presume any of the larger nurserymen keep Concord grapes. We notice them listed in catalogue of the Fancher Creek Nurseries, and presume others have them also.

Melons and Walnuts.

Please give me a detailed description of the Cassaba melon, also the Placentia Perfection Walnut, at your earliest convenience in your valuable paper..—G. S. B. Healdsburg.

The Casaba melon grows to about the size of the large musk melons, that are seen on the markets, is almost white on the ground side, and light green over the balance with shadings to almost white in places. The divisions are like those in the musk melon, but instead of netting, the surface is wrinkled and ridged in small folds that run in the same direction as the divisions. It ripens late and is a fine winter melon.

The Placentia Perfection walnut originated at Placentia near Fullerton, and is a selected seedling of tne regular English walnut. It averages good size, is symmetrical, with a full kernel which is light colored. It is impossible to describe it so that you would know it on sight from other good walnuts. It is considered an improvement on the old nut, and when compared with them, the difference it at once apparent. You must see the nut to know it.—J. W. M.

Bacteria for Legumes.

Please answer in your paper, whether the United States Government, still furnish bacteria germs for fertilizing beans.

We have new land to plant to beans. Is it difficult matter to increase from a small start enough for 150 acres.

Will it pay to graft seedling apricots that have grown but two years in nursery rows. Would it be better to dig them up and use the roots for grafting into?—A Subscriber, Montaivo.

We do not know if the U. S. Government still distributes the bacteria for bean culture, but the seed firms advertise it. The quickest and just as an effective method is to get some soil from a field in which beans grew last year and mix it with the beans by putting a shovel full into the hopper of the seeder when you are planting. Mix it so that all the seed will come in contract with some of the dirt.

It will pay you better to grow new seedlings and bud apricots onto them at the proper time. There is no root system for a peach or apricot, as one grown from a seed. A one year root is the best.—J. W. M.

Luther Burbank's Address.

Please publish the address of Mr. Luther Burbank and oblige.— A subscriber, Fallbrook.

Santa Rosa, Cal. We would not advise, however, that our subscribers write him very promisciously, for he is a very busy man and all correspondence except that of business or of unquestioned mutual interest should be avoided. The lives of such men are often made quite burdensome by thoughtless correspondents.

The Cultivator is in receipt of the 1907 catalogue of the Western Gas Engine Co. This is one of the handsomest catalogues, in a quiet and dignified style, that has ever come to the Cultivator office. It contains 64 pages, illustrating the various types of engines manufactured by this company, three pages of general information about gas engines, and some very valuable tables of general information, such as, "comparative cost of operating on different fuels," "the effect of altitude on the power of gas engines," "table of horse power required to raise water to different heights," "table of friction of water in pipes," and other equally valuable information. The catalogue, like the engine, was produced in Los Angeles, and will be mailed free to inquirers.

Tommy Twaddles—Pa, what is the meaning of 'financially embarrassed?"

Pa Twaddles—"Financially embarrassed, "my son, is a long expression for a short condition.

Jimkins—And how has he come into this good fortune?

Simkins—Invented an inkstand that you can't get the paste brush into.

A Patient Worker With Plants

In the December 6th issue of the Cultivator we spoke of the success which Mr. J. B. Wagner, has secured at his experimental farm on the sunkissed slope at the base of the Sierra Madre, above the City of Pasadena. That article has caused some little inquiry as to Mr. Wagner and his work, so that we may turn for a moment for a look at the man and what he has accomplished.

A born plant lover and almost a lifetime nurseryman with keen observation and ability to see the needs of the horticulturist, he always strived to produce that which will give great pleasure to his fellow beings and at the same time prove a source of profit to the soil tiller.

When Luther Burbanks first made known the wonderful merits of his Crimson Winter Rhubarb, it was received skeptically by many who looked at it as a nurseryman's boast for some old and well known plant under a new name, but Mr. Wagner, true to his instinct of constantly getting something better, promptly sent in a large order which was the first from Southern California. The success which "Crimson" achieved is now a well known story and of course anyone can look at a success and say that was easy, "anyone could have done that." But when Mr Wagner ordered his bunch of roots of the new plants, only a few hundred, no assurance could be given that it would amount to anything in the arid Southland. No other rhubarb had been a success there. Why should this be? Why pay a good long price for a few roots which would bring to a whole community a large increase in wealth if it proved a success and yet if a failure the loss would not be shared a little bit?

But Mr. Wagner did not qestion this but soon was testing on his little ranch the merits of the new plant.—It won.

Mr. Wagner soon saw its success was assured and pushed its propagation to the fullest; not that he proposed to keep its advantages to himself but that it might have widest distribution and extended benefits. This has not always been done for a consideration for there are many instances when plants have been supplied to organizations which will give proper distribution to those who will give proper care to the plant.

Mr. Wagner expects reports as to the manner of growth in the various sections but other than that received no compensation from those free distributions.

In addition to his work of propagating the Crimson Winter and distributing it, Mr. Wagner took time to observe its habits and its limitations, and to wish that its one or two faults might be eliminated,, knowing well the wonderful results accomplished by hybridizing, he began a search for other varieties of rhubarb which possessed desirable traits which might be bred into the Crimson Winter and at the same time return all the desirable features of the Crimson.

A series of patience trying experiments were taken up, mostly failures, some gave a little hope. The least promising did not discourage Mr. Wagner, he isn't that kind, but patiently continued planting, testing, destroying, then beginning all over again. Success finally came and a rhubarb with the merits of the Crimson Winter with greater size and length of stalk, and with less propensity to run to seed-stem was the result.

The name which has been suggested for this plant and which Mr. Wagner has accepted is: "Wagner's Giant Rhubarb" which will, we believe, some day express as much regarding a success in the line as does "Washington Navel," express one of the greatest successes of horticulture.

But is it as yet a complete success? In itself, yes. But one feature of it is yet to be determined. Will its seed bring forth offspring true to its parent or will it "sport" and bring any old kind of rhubarb? Mr. Wagner hopes much, but as yet no plants will be permitted to leave the experiment grounds till this one fact is determined. If disappointment comes, it will be quietly laid on the shelf with a thousand others and a new beginning made. That's Wagner.

Meantime Mr. Wagner is using his experience and knowledge of the rhubarb plant to select the most thrifty grower, and the most promising of the regular Crimson Winter which he is perpetuating and increasing till he has many thousands of plants for sale. Notwithstanding his care in this respect he is holding at no exorbitant price but selling reasonably, considering the care and selection which he gives.

J. B. Wagner, showing a rhubarb plant eleven months old, with a root more than four feet long. Also showing bunch of stems 18, 28 and 34 inches long.

A letter to Mr. Wagner will bring futher information, or better, a call at his home will give more pleasure and a glimpse at a man who thoroughly loves plants and loves to work with them and make them show their highest development by his work.

"Little Breeches"

I don't go much on religion,
I never ain't had no show;
But I've got a middlin' tight grip, sir.
On the handful o' things I know.
I don't pan out on the prophets
And free-will and that sort of thing—
But I b'lieve in God and the angels,
Ever since one night last spring.

I come into town with some turnips,
And my little Gabe come along—
No four-year-old in the county
Could beat him for pretty and strong,
Peart and clipped and sassy,
Always ready to swear and fight—
And I'd larnt him to chaw terbacker
Jest to keep his milk teeth white.

The snow come down like a blanket
As I passed by Taggart's store;
I went in for a jug of molasses
And left the team at the door.
They scared at something and started—
I heard one little squall,
And hell-to-split over the prairie
Went team, Little Breeches and all.

Hell-ot-Split over the prairie!
I was almost frozen with fear;
But we rousted up some torches.
And sarched for 'em far and near.
At last we struck hosses and wagon,
Snowed under a soft white mound,
Upsot, dead beat—but of little Gabe
No hide nor hair was found.

And here all hope soured on me.
Of my fellow-criiter's aid—
I jest flopped down on my marrow-bones
Crotch-deep in the snow, and prayed.

By this, the torches was played out
And me and Isrul Parr
Went off for some wood to a sheep-fold
That he said was somewhar thar.

We found it at last, and a little shed
Where they shut up the lambs at night.
We looked in and seen them huddled thar,
So warm and sleepy and white;
And thar sot Little Breeches and chirped,
As peart as ever you see,
"I want a chaw of terbacker,
And that's what's the matter of me."

How did he git thar? Angels.
He could never have walked in that storm;
They jest scooped down and toted him
To whar it was safe and warm.
And I think that saving a little child,
and fotching him to his own,
Is a derned sight better business
Than loafing around the Throne.

JOHN HAY.—

A Social Prank

IT WAS a gay winter in Beverly. The young people of the town had caught the spirit of mirth and as the season progressed gave themselves up to it more and more. The shape it took was social pranks. A rumor was started that Alan White had eloped with Susie Carr. The pair kept under cover for a few days, then appeared at an evening party together, received congratulations, then laughed at their dupes. A ball once set rolling will roll on till it meets some obstruction. No sooner had the mock elopement succeeded in deceiving every one than certain boys and girls decided there must be a mock marriage.

The couple selected for principals were George Towle and Jessie Troxell. Sufficient "spooning" had been noticed between the pair to give color to a wedding. A committee of one was sent to Towle to sound him on the subject and returned with the report that he would not object. Miss Troxell took time to consider the matter, but when it was announced that a goodly number of wedding presents might be expected and the donors would not be likely to take them back after having learned of the "sell" she consented. thereupon the details of the affair were arranged by a self-constituted committee of six—three young men and three girls.

Ned Tracy and Kate Dexter constituted themselves chairman and chairmaness of the committee and assumed full management. There was no opposition to this till it was learned that they were incurring the expenses of a real wedding, but since Tracy and Miss Dexter, who were wealthy offered to pay all bills they were permitted to proceed at their own breakneck pace. This was definitely settled before the bride and groom would consent to such extravagant outlay for a mere prank and for which they might be held accountable.

Recognizing Miss Troxell's sacrifice and to keep her up to compliance with the scale on which the prank was to be played, the committee sent her articles which formed quite a respectable trousseau. This done, they ordered a thousand invitation cards. Miss Troxell's domicle being very small, the wedding was appointed to take place in Harmony Hall, where such social functions were held as comprised too many people to get comfortably in a dwelling. The cards were no sooner out than wedding presents began to pour in. A young minister who had been brought up with the boys and girls interested, was engaged to perform the ceremony. Of course he was in the secret and had declined till notified that at the proper time the bride was to say "No" instead of "Yes." Then the "sell" was to come out, and the festivities were to proceed with a dance.

For weeks even before it was known that there was to be a wedding Mr. Tracy and Miss Dexter were hard at work, Miss Dexter buying the trousseau and Mr. Tracy engaging the hall, ordering flowers—in short, attending to the details. After the cards were out a multitude of matters were thought of that had been overlooked.

The only thing that mighty possibly excite suspicion was the action of the bride and groom. They were never seen together and until after the cards were out would not acknowledge their engagement, but from that time on they kept in their own homes, and Miss Troxell especially would see no one.

When the night of the mock wedding came on, the committee, who, except the couple who were to be mock married and the clergyman, were the only ones in secret, were on a tiptoe of excitement. Mr. Tracy and Miss Dexter figured up the expenses and concluded that the prank should be very successful to be commensurate with the cost. When the hall was filled with guests, Tracy sent carriages for the groom, the bride and the clergyman.

As Miss Troxell entered Miss Dexter was much pleased to hear some one say: "What an exquisite costume! I wonder who designed it." The entrance of the couple was a signal for the guests to arrange themselves in their proper space, leaving one end of the hall for the bridal couple. Tracy was a bit worried because they acted, he said, "as if they were going to get

WAGONS
There is always one by which the rest are judged. Ask any farmer which wagon he places the most confidence in; ask any expressman which wagon lasts the longest with fewest repairs. The answer will be,
The Studebaker
No one ever claimed to make a better wagon than THE STUDEBAKER. It couldn't be done. Many are said to be "just as good." If none is claimed to be better by the competitors, and the Studebaker is looked up to as the standard, isn't it pretty good evidence that it is the best?
Every wagon put out by the Studebaker factory is as near perfect as it is possible to make it. Everything from tongue to tail-board is of matchless superiority.
Don't waste money on an inferior wagon, but begin right and get a STUDEBAKER. These wagons, in various sizes, may be seen at the large salesrooms of the

a divorce instead of being married."

The groom approached the clergyman from the left, the bride from the right. The members of the committee pushed forward through the crowd to a white ribbon that had been stretched across the end of the hall in order to catch every word and note the expressions of surprise on the faces of the guests when the bride should bring out the unexpected "No."

The clergyman began the service in the tone usual to the solemn rite of matrimony, and when he came to the words, "Do you take this woman to be your wedded wife?" Towle answered in a sonorous voice, "Yes." "And do you take this man to be your wedded husband?" the clergyman asked of the bride.

The sensation that had been arranged for the guests was experienced by the committee. In a clear, firm voice the bride answered, "Yes."

The secret of how Mr. and Mrs. Towle were furnished with a wedding which they could not possibly have afforded a trosseau and wedding presents that would not have come in a less pretentious affair has been well kept by the committee, especially by the chairman and chairmaness, who paid the bills. The craze for social pranks at Beverly came to a sudden end and has never since been revived.

THE ORANGE'S STORY.

He had been romping happily all the morning, the big dinner had come and as surely gone, uncles and aunts had played with and told stories to him, the memory of the bright Christmas tree danced before his sleep entangled eyes as, hugging a large orange he fell asleep on the rug.

"Little boy," said the orange "I want you to promise me something before you eat me."

"What for?" said the little boy.

"Because I got yellow and sweet on purpose for you to eat," said the orange.

"What shall I promise?" asked the dreamy boy.

"Plant my seeds," said the orange.

"I will if papa will let me," said the little boy. "Where did you grow anyway? Tell me all about it, Mr. Orange and why did you get sweet on purpose for me to eat?

"It's way out in California," said the orange. First I was a pretty white blossom among thousands of others on a big, glossy-leaved tree. We sent out the sweetest scent you can think of to tell the bees we wanted them. They knew, and came by myriads and their busy happy hum among our sweet scented flowers made us all glad. We gave them of our honey and they collected and gave us pollen.

"What's pollen?" said the little boy. "I know honey; it's good."

"Pollen is a dusty little grain, very pretty to look at through a bees eyes, that we flowers need to give our seeds life, and then we orange people make the sweet fruit grow round the seeds; so people may like us and take us to different places and so we get our seeds sown and other trees started. All growing things have some way of sending their seeds away from home; ours is the best way don't you think?"

"'Deed I do," said the little boy. "Its cute of you. Tell me how you lived and how you got here; I like stories."

"Oh, I sat way up in a tree. The first thing I heard was a little girl saying "why papa, there's some wee bits of green oranges.' 'Sure enough, daughter; about the size of your nose, ain't they? The crop's setting fine.' A linnet hopped about among our twigs and branches; once a pretty quail slept all night close to me. I watched the farmer's team pulling the plows past us; watched the sun rise over the mountains and was glad of its warmth; watched the streams of water washing our trees' feet, as they let the streams water us and so grew and grew. Early one morning I heard the farmer say, as he was looking us over to see if we were turning from green to yellow:

'I saw a pesky owl round here last night.' The owl was on our bough, and he crouched low. 'Strange,' he said 'how farmers hate us. As I told you, I was out looking for gophers—gophers that would eat your roots and not care if you all died.' He had been telling us about things outside our orchard. It was he that told us about the bees."

"It's strange," said the little boy, "farmers don't know their friends; I would."

"Soon after this, as I was getting golden, I felt a sharp clip, clip, and I tumbled over into a bag with lots of others, all too roughly we were jolted along the road dumped into some water among a lot of revolving brushes, rolled down all bright and clean along a latticed runway to dry, passed dropping as we went along two moving ropes that got wider apart, so as to size us into companies alike, then got wrapped in paper and tucked into a box, before we really knew what was coming to us. As I was being tucked away I heard the girl say: "I wish I was going where this orange is; it would be fun to have an old fashioned snow Christmas.' 'Give me California, every time,' said the other girl. Then I knew I was going to travel, and I did. So when your papa asked for a dozen oranges in the store where our box was finally opened, I knew I was in for a snow Christmas. I suppose the girl meant your Christmas tree, with all that glittering white stuff."

"That's where you're off," said the little boy. "That ain't snow, but I'll plant your seeds for you all the same."—T. J. ASHBY in Pasadena News.

Household Recipes

Potato Wands and Broomsticks.

Pare eight good sized potatoes and soak them in cold water for two hours, cut in tiny wands and broomsticks, fry in deep fat. Drain on paper, sprinkle with fine salt and serve hot.

Deviled Chestnuts.

Remove a small piece of shell from each chestnut then roast them until tender. Remove the shells and inner skins. Put ont tablespoonful of butter into the blazer of the chafing dish and when hot saute in this a cupful of roasted chestnuts. Sprinkle with salt and paprika. Serve with the cheese and salad course or with game.

Rabbit With Gravy.

Skin the rabbit and wipe it with a towel dipped in boiling water to remove the hair, dry and cut first down the back then cut each half into four pieces. Cover with boiling water and let boil five minutes, season with white pepper and salt, add slice of onion and stir gently till tender. Remove the meat to a hot platter, add a cupful of cream to the stock, rub butter and flour to a smooth paste and stir into the stock, let come to a boil; add a little minced parsley then the meat, heat again and serve.

To Cure a Cold In One Day.

Take LAXATIVE BROMO Quinine Tablets. Druggists refund money if it fails to cure. E. W. GROVE'S signature is on each box. 25 cents.

WITH A SIEVERT OIL BURNER

You can burn 100,000 cubic feet of air with every 130 gallons of oil; this means perfect combustion. To burn more than 100,000 cubic feet of air with 130 gallons of oil, there is a decided loss of heat. To burn less than 100,000 cubic feet of air there is a loss of fuel. The only safe and reliable burner on the market. Send for full particulars.

Tom Lewis' Fertilizer The Best and Cheapest

For Orchard, Garden or Field it has no equal. A trial will convince you of its merits. Send for my circular of testimonials.

Tom Lewis brought to this office an orange weighing two (2) pounds, grown by W. J. Wilson, a prominent orange grower and vineyardist of Newcastle, Placer County, who has used Tom Lewis' Fertilizer for four seasons and swears by it.—FROM SACRAMENTO EVENING STAR, DECEMBER 23, 1904.

Office and Works, 1916 and 1918 10th St., Sacramento, Cal.

MORSE SEEDS SPROUT
You and Nature do the rest

Alfalfa

from the best UTAH alfalfa section—clean and free from dodder and weed seeds. Also TURKESTAN alfalfa—recommended by the U. S. Department of Agriculture for dry land. Samples and prices of both, on request. If interested in CLOVER and GRASS SEEDS, and ONION SETS, write us.

Seed Catalogue now ready—send your name and your friends' names and addresses—for copies free.

Address

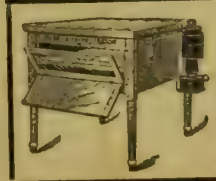
Mrs. C. D. Hubbard Box 282 San Fernando, Cal.



"Sure Hatch" Incubators and Brooders

Are known the world over for their ***Simplicity*** and ***Reliability***. It is useless to place in the hands of a novice a machine that would puzzle a scientist. That is what we do not do. We guarantee them for five years, and positively stand by the guarantee. Send for free catalogue No. 25. It is full of poultry matter.

Doke Stock Food Co.

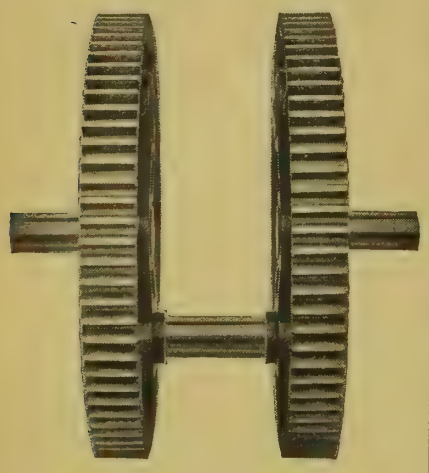
The Pomona Pumps Are Best



for City Waterworks and Irrigation

BECAUSE—

Using machine cut and slow running gears, they are

PERFECTLY NOISELESS.

They use stepped gearing with no break in the tooth contact, doing away with all rattle and vibration.

BECAUSE—

They have an ideal motion of the pump rods, which consists of a uniform continuous slow up motion, a smooth, quick down movement with absolutely no jerk in starting the rods upward eliminating all rod breakages and valve troubles.

BECAUSE—

They will save you money in cost for power. We use machine cut gearing which alone saves ten per cent. We have a leverage in our gearing which other pump makers do not have and which they do not tell you about when trying to down us.

BECAUSE—

In pumping through long pipe lines, they deliver a continuous steady stream.

They do not hammer out your pipe line by irregular pulsations of the water column.

They save power by keeping the water in continuous motion.

BECAUSE—

They are fitted with improved oiling devices that can be filled without stopping. Pumps may run for weeks continuously.

BECAUSE—

We have advantages in our pumps that investigators appreciate at once, consequently, where one goes others follow and we are fast taking the country.

BECAUSE—

We give a guarantee of satisfaction with every plant.

Send for catalog.

Dry Farming Congress

For the first time in the history of America a general movement has been inaugurated looking toward the rapid development and settlement of the dry land sections of the west. Acting on the suggestion of many of Colorado's business men Gov. McDonald of this state has called the "Trans-Missouri Dry Farming Congress" to meet in Denver on the 24th and 25th of this month. The call has been sent to every state west of the Missouri river and assurances have already been received that delegates will come with state sanction, from practically all of the sixteen common-wealths included in the call.

The importance of this movement cannot be over estimated. Nine acres of farm land out of every ten in the whole country west of the ninety-eighth meridian can never be irrigated, and because of slight rainfall, most of this great territory must look for its redemption entirely to some method of scientific agriculture. Within the last decade the spread of the so-called Campbell system, more commonly known as "dry farming" has convinced the thinking man of the country that in some such method as this lies the agricultural salvation of the west, and it is now proposed to start a broad unprejudiced movement in which every state affected shall take part, to further develop these soil culture systems and bring them to the attention of the world at large.

It is necessary, also so it is said by those who are interested, that some steps be taken to educate the farmers who are today coming into the dry land of the west. In Colorado alone 75,000 new homeseekers have settled themselves within a year. Twelve hundred homesteads in Kit Carson County, Colorado, were taken up in 1906 and this record was almost if not quite, equalled by other counties in other western states. Of these great bodies of settlers, the larger proportion are from the eastern states, and are entirely unfamiliar with western conditions.

The purpose of this Congress which will meet in Denver this month is, first of all to form a permanent, educational, interstate organization somewhat on the line of the National Irrigation Congress, and second, to afford a full and free discussion of the principles of scientific soil culture, and of their development in the west. Speakers will be present from every state west of the Missouri river. The United States Deparment of Agriculture will be represented, it is hoped, by Secretary Wilson. Every agricultural college in the west will have its man in attendance. Mead of Washington Campbell of Nebraska, Olin of Colorado, Jardine of Utah, and a score of others of the brightest agricultural minds in the country are on the program, and few things that refer to dry farming will remain unsaid.

In order to prevent the gathering of a large and unwieldly voting body, Governor McDonald has limited the number of official delegates who may attend. Los Angeles County, however is entitled to ten delegates. Copies of the official call and an urgent invitation to appoint delegates at once, have been sent to the County Commissioners, and it is expected that they will act in the matter within the next few days.

In spite of the voting limit however, it is desired that every farmer and business man in Los Angeles County who is interested in dry farming and can get away from home should attend, regardless of whether or not he is an official delegate from the county. Convention headquarters have been opened at Room 5, Albany Hotel, Denver, where all visitors to the city will be made welcome and full information given.

BEMIS BARRED AND WHITE PLYMOUTH ROCKS

PRIZES WON At Alameda County Poultry Association Show, Oakland:

21 Regular Prizes.
4 out of the 5 Specials given by the American White Plymouth Rock Club.
Silver Cup for the ***best collection*** in American Class.
Silver Cup for ***best display*** in American Class.
Hines Silver Cup for 10 Best White Plymouth Rocks in Show.

I am able to ***furnish*** the ***best*** birds and eggs at moderate prices. I cannot furnish large lots for incubators.

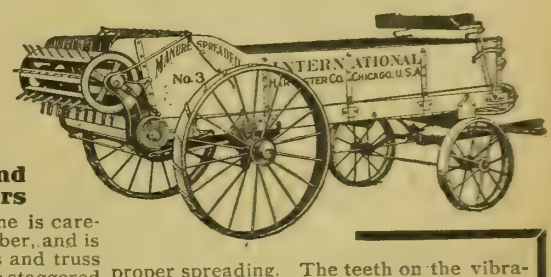
MRS. FLORENCE E. BEMIS, 1757 NINETEENTH AVE., OAKLAND, CAL.

Chicks Just Hatched **We ship them everywhere. Pure Bred White Leghorn Chicks from the Best Egg Producers in the United States**

CALIFORNIA INCUBATOR CO., MAXWELL, MAY 27, 1906.
Gentlemen—The little chicks arrived in perfect condition. It is very remarkable that 600 little fellows would come so far and being so long on the way without the loss of a single one, but it is an undisputed fact that such was the case. We are thinking of getting a few more providing we can get them right away. Answer by return mail. Yours truly, J. F. CAMPBELL.

CALIFORNIA INCUBATOR CO., 907 Washington St., Petaluma, Cal.

A Common-Sense Talk On
Manure Spreaders



I. H. C. Corn King and Cloverleaf Spreaders

THERE'S no doubt that the right kind of manure spreader is a good thing for you to have. It is probably true that there is no other farm machine that, if rightly chosen, is as valuable to the farmer. If manure is spread properly and at the right time, its money value far exceeds what you're apt to think.

But when you buy a manure spreader have a care. There are many of them on the market, and many with various "special features"—fancy affairs that do them more harm than good.

When you buy a spreader look out for these things—and avoid them. What is chiefly to be desired is *strength* and *simplicity of construction.*

Strength is essential because a manure spreader has to carry a heavy load and the rear end—the *machine* end—has hard work to do.

Simplicity of construction lessens the chance of the machine getting out of order and gives *light draft.* You know there are a good many manure spreaders that don't get out of the shed after the first year. They are too troublesome; causing much delay.

are strong and simple. The frame is carefully-selected, well-seasoned lumber, and is strengthened by heavy cross sills and truss rods. They have steel wheels with staggered spokes, and both hind wheels have clutches. The box is made of selected stock and is securely fastened to the frame by heavy steel cleats. Corners are re-enforced with steel plates. Everything is of the very best.

Both of the rear wheels are drivers, and insure plenty of power. A large sprocket with heavy chain drive transmits the power to the cylinder The cylinder is large and strong, and the square teeth (extra long) are made of the best high carbon steel.

The power for driving the apron is applied on both sides, giving an even movement and making binding impossible. The rollers are attached to the under side of the slats instead of to the frame.

The vibrating rake is a most important feature, and is found only on Corn King and Cloverleaf spreaders. It levels the load and brings the manure squarely up to the cylinder —a thing which is absolutely essential to proper spreading. The teeth on the vibrating rake are held in place by coiled steel springs so they never break but adjust themselves to the size of the load.

And as a result of simple construction, the operation is simple. Any one who can drive a wagon can operate an I. H. C. spreader, for one lever does it all. There are ten feeds, ranging from ten to thirty loads per acre. The apron stops of its own accord when the load is all fed out. By reversing the lever it returns and again stops when back in position. No need to watch it at all.

These are some of the reasons why you should investigate I. H. C. Corn King and Cloverleaf spreaders before you buy. There are many other good points about them that are explained in our catalogues. There are two kinds—Cloverleaf, an Endless Apron machine, and Corn King, a Return Apron machine; each made in three sizes.

The Smyrna Fig of Commerce

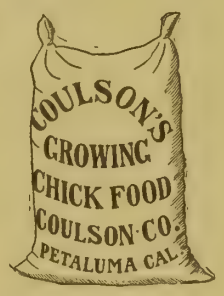
The Introduction of This Fig to California Orchards Will Rank as One of the Greatest Horticultural Achievements in the History of Our State

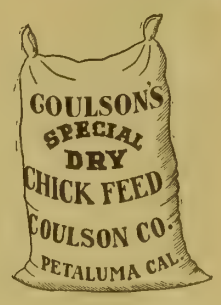
Packing Calimyrna Figs at Fresno

No one thing of recent years is fraught with so much that is full of promise and future greatness to Californa horticultural wealth as the successful introduction of the genuine Smyrna Fig of commerce, together with the Fig Wasp. The introduction of the Washington Navel orange was certainly an event of prime importance, which has added millions to the wealth of the State, but the culture of the orange is, after all, more or less confined to the thermal regions of that State, where biting frosts are unknown, and the thermometer never goes below 22 degrees, and that only for brief periods, for a prolonged cold spell at even 26 degrees, is quite apt to cause serious damage to the crop.

With the fig, however, the area adapted to its culture is much wider. It can withstand 18 degrees and not suffer. Hence its geagraphical distribution is much wider, and as applied to the Pacific Coast, embraces nearly all portions of this State, the sheltered sections of Arizona and New Mexico and Southwestern Texas. As it influences local horticultural development, the Smyrna Fig industry is an epoch-making event, destined to add materially to our rural wealth, and afford a livelihood and employment in all of its ramifications to a large portion of our population.

The introduction of the Capri Fig, which serves as the home of the Fig Wasp, which fructifies the Smyrna Fig, renders commercial fig culture feasible; the tree has a wide range of soils and climates in which it will flourish; it is of easy culture and exceptionally free from injurious insects and diseases; requires but little pruning; is a regular bearer of annual crops which are practically exempt from in jury by frost, because the fruit does not set until early summer; the expense of harvesting a crop is purely nominal, as the fruit drops when ripe, thus only gathering is necessary; drying is simplicity itself, requiring less labor than peaches or apricots; in its dried state the fruit is not perishable, like green fruit, hence, can be held at the convenience of the grower; and, finally, the demand is much in excess of the domestic supply, thus insuring a market for years to come for homegrown Smyrna Figs at profitable prices.





Coulson's Growing Chick Food

Is a mash feed for the growing chicks, designed for feeding when you leave off feeding Coulson's Special Dry Chick Food, composed of articles, each the best in its class, combined in the correct proportion to form

A PERFECT BALANCED RATION

It contains blood meal, meat meal, bone meal, and other articles rich in protein, and the other elements, and is the feed you need to make your chicks excel in size and weight and enable them to become strong, vigorous and heavy-laying fowls.

COULSON'S GROWING CHICK FOOD WINS OUT

San Marcos, Cal, July, 23, 1906.
Gentlemen:

I tried COULSON'S GROWING CHICK FOOD exclusively my first year in business on Brown Leghorns. I sold the cockerels as broilers at nine weeks, averaging 2 pounds, 3 oz. each.

I tried my own mixture of feed the next year and took the same care of the chicks, and sold 75 cockerels as broilers, weighing 105 pounds, making an average of about 1 1-4 pounds each.

Having tested at my own expense the two methods I have concluded that COULSON'S FOOD is superior.

(Signed) J. B. HOOVER.

Coulson's Special Dry Chick Food

Is acknowledged by all The Best and most Reliable Feed for Baby Chicks.

COSTS LESS THAN 2 CTS. FOR FIRST FOUR WEEKS

ONLY HIGHEST QUALITY GRAINS, ETC,, USED

Special Dry Chick Food contains numerous different seeds adapted to needs of the little chicks, besides meal, charcoal, bone and many other necessary articles, each in Granulated form making

A PERFECT BALANCED RATION

CANNOT PRAISE IT ENOUGH

"I cannot say enough in writing in praise of your Special Chick Food. It is just fine. I never saw chicks do so well before."

J. S. SCOTT, Madison.

PULLETS LAY EARLY

"I have fed your Special Chick Food and Growing Chick Food to all my stock with one exception. I tried one lot of 350, and fed them my way of raising chicks back East. Results just fair. The other were fed up to three months on your Special Chick Feed, and the results were a surprise to me. The birds were large and the cockerels out of one lot I sold to the California Market and got a big price, with the request to send on to them at any time I had more cockerels of the same quality."

Respectfully, A. P. WARD,
Calistoga.

USE COULSON'S AND BE SATISFIED

SPECIAL OFFER.

Where Coulson's Special Dry Chick Food cannot be obtained from local dealers, we will ship, freight prepaid to any railroad station in California, 100-lb. sack for $4.00, or 200 lbs. for $7.50, cash with the order.

Southern California Ground Waters

Important Publications on the Available Supply of Water for Irrigation in Southern California, by the United States Geological Survey

THE RESULTS of an extremely practical and purposeful investigation of the ground water resources of the coastal plain region of southern California have recently been published by the United States Geological Survey. These reports cover the region along the coast from Santa Monica to Aliso Creek, and extend inland over the coastal plain to the foothills from San Pasqual on the northwest, through Santa Anita, Glendora, Pomona, and San Bernardino, to San Jacinto on the southeast.

Throughout this whole area the people are dependent mainly upon ground water for their water supply, and much of the prosperity that has been realized in this country has resulted from irrigation by ground waters. Therefore the future is largely dependent upon the availability of these waters and their permanence.

The reports mentioned deal with these questions in a practical way and show where ground waters may be obtained, the depth at which they occur, and what may ultimately be expected if the present improvident use of the water is continued. In order that the reports may be distributed in the most helpful manner the region has been divided into the western, central, and eastern sections, and each has been treated in a separate bulletin.

The western section includes the Redondo and southern half of the Santa Monica quadrangles. This region may be geographically defined as that part of the country lying westward from a line running north from San Pedro Bay through Los Angeles and Glendale to La Cresenta. The central section includes the Downey and Las Bolas quadrangles, and may be geographically defined as land lying eastward from the line above located to a north and south boundary defined by Westminister, Whittier, and Monrovia. While the central section includes the area lying to the east of this as far as San Bernardino and San Jacinto.

Completed tables giving the facts concerning the wells throughout this region are included in the reports,. They show the yield of each well, the capacity, and depth at which water occurs, as well as the cost of operation.

With reference to the supply of the entire region the report states that in all of the important basins there has been during the last ten years a general reduction in the yield of the artesian wells. The last ten years have constituted a period of low rainfall, and as a result the ground water supply has been diminished, and it is evident that there should be no further increase of the drafts upon the under-ground resources. The rate of this decrease even under the influence of the great development that has taken place has been very slow, and while it is probable that in some basins some of the favorably located wells will never cease to flow, the shrinkage must continue in other places unless there is a concerted effort upon the part of the irrigators to be economical in the use of water.

The summary given by the author of these reports, Mr. Walter C. Mendenhall, is as follows:

The supply is large, since it consists of the water saturating all that part of the coastal plain gravels within about 250 feet from the surface over an area of 600 or 700 square miles.

The annual additions to the supply are large, consisting of a part of the flood waters of the San Gabriel, Los Angeles, and Santa Ana Rivers, together with the return waters from irrigation and the local rainfall. The drafts upon this supply are also large and seem certainly to be in excess of the supply in certain parts of the region.

With present developments the water plane must be expected to decline slowly and the artesian to shrink until drainage is checked by this shrinkage to a point where it no longer exceeds the supply. This decline should not prove serious if present developments are not increased, but so long as this development continues at a rate which increases the output, the shrinkage will also continue.

The lowering of the ground water level and shrinkage of artesian areas will no doubt be interrupted by periods of rising water levels.

The shrinkage of an artesian belt will be manifest along its northern edge, and the effect farther south will be rather a decrease of flow and a lessening of pressure.

Shallow artesian wells will generally be affected earlier and to a more marked extent than the deeper ones.

One of the maps included in this series of reports shows the artesian areas and the shrinkage which has already occurred. For example, the great artesian area running along the coast from a point west of Los Angeles to a point south of Santa Ana already shows a shrinkage along its northern and eastern borders equal to about one-fourth of the original area, while that south of Pomona shows a shrinkage of approximately 10 per cent. The San Bernardino area has likewise been reduced about one-half, and that north of San Jacinto shows a shrinkage along its northern border equal to about one-fifth of the original artesian area.

These reports should be consulted by every irrigator along the coastal plain. They give most potent warnings concerning the loss of water supply which, it appears, may be avoided if intelligent measures are adopted. Inasmuch as this garden spot of North America has been developed solely as a result of irrigation by ground waters, it appears that the inhabitants of the region can do no better than to organize and adopt such measures as are recommended in these reports.

Deciduous Fruit Culture

By J. W. MILLS

ORCHARD FERTILIZERS.

THIS subject was handled by Mr. Utter, Conductor of Farmers' Institutes of Wisconsin, giving the principles taught in that State in regard to purchasing and use of fertilizers. He declared that it was a waste of money to pay freight on certain mixed fertilizers when the same elements can be brought here in a much more condensed form. He advised using the simples, that is sulphate and chlorate of potash, superphosphates in their most condensed form either singly or together as needed an extra feed at times when it was not possible for the liberation of nitrates in the soil to take place. It is known that this takes place only when the temperature is high and trees need a good supply of it when they are sending out the new spring growth and setting the fruit. Mr. Utter emphasized the fact that what we got in our complete fertilizers over and above the actual elements of combination of potash, phosphoric acid and nitrogen, must necessarily be filler, which is of little use and on which we must pay that much useless freight. It sounded good to hear a visitor say these things for the State Agricultural Department has been telling these things for years and in many cases has been unheeded.

He touched upon the need of maintaining the maximum amount of humus in the soil, giving its office and explained how it affected the soil. He told the audience that if a small piece of earth were placed beneath the microscope and the spaces between the articles were filled with small particles of fiber, it was humus that we saw and this prevented the evaporation of moisture which explains why soils rich in humus require less irrigation than do soils poor in humus.

It is commonly supposed that the climate of the Eastern States is better adapted to the growth of green manuring crops than is the climate of California. The speaker said that we had the advantage because we could grow them during the winter and also part of the summer time. In the North and Middle States, it is impossible to grow such crops during the winter months, and when growing time comes, the staple crops must be planted and the latter part of the summer is all that is left in which to grow a green-manuring crop. This is not long enough to get much growth and after some crops no fertilizer crops can be grown at all. In such cases crop rotation is the only alternative.

Another point in favor of California climate, is the utilization of the rainfall. The soil here is never frozen so that it will shed the water and as a consequence, the greater part of it is soaked into the soil. In certain parts of the East, the ground is frozen all winter and the rain and melted snows runs off and very little of it goes into the soil where it will do the most good. This interesting talk brought out the fact that everywhere scientific farming is underlaid by the same general principles, and if a man is clear-headed enough to make the proper application of them, there is no reason why he cannot succeed in the end.

PRUNING PEACH TREES.

Experiments conducted by the Missouri station to determine the best method of pruning peach trees have yielded results which may be summarized as follows:

Under normal conditions, when peach trees have passed the winter safely and promise to produce a crop of fruit, they should be pruned each winter by cutting back the main limbs, so as to leave one-half to two-thirds of the new growth which contains the fruit buds.

When the fruit buds have been winter-killed the opportunity may be seized to cut back the main limbs more severly, thus securing more compact trees, and avoiding the formation of long, straggling limbs which the trees have a tendency to form if they are not cut back.

The amount of cutting back depends upon the extent to which the trees have been injured.

If only the fruit buds have been killed, and the wood of the tree is uninjured, trees of compact form, if they have been annually pruned, should have their main limbs shortened so as to leave only a few inches of the new wood. If, however, the limbs are getting long and straggling they may be cut back into two or even three year old wood. Before severe cutting is done the grower should be certain that there are enough live buds left to produce fruit. The peach sets such an abundant quantity of fruit buds that if a small percentage of them have escaped injury there may still be enough to produce a paying crop of fruit.

When the winter is so severe that not only the fruit buds are killed but the wood of the tree is badly discolored the trees may be invigorated by cutting them back quite severely. The following is a summary of results of pruning peach trees during the severe freeze of 1898-9:

Peach trees which were not pruned, or in which only a part of the new wood was removed after the severe freeze of 1898-9 started into growth first in spring and for two weeks after growth began they appeared to be in more vigorous condition than did pruned trees.

This apparent vigor of trees that were not severly pruned was only temporary, however. Some of them died a little later and none of them made satisfactory growth throughout the season. They seemed to have used up all their energy in making a new start. At the close of the season they had made but little new growth and this was confined mainly to the tops of the branches, and the old limbs and trunks containing only dead twigs. Their annual layer of new wood was very thin and some of their roots died.

Trees of bearing age that were cut back so as to leave only the trunk and bases of the main limbs died in some cases and where they did live their growth was unsatisfactory, many of the sprouts starting from the unreliable seedling stock below ground.

Trees of bearing age which were cut back into two years old wood in the case of young trees, and to three or four year old wood in older trees, thus leaving stubs of the main limbs from three to four feet long made the best growth. They made from six to nine feet of new growth and entirely renewed their heads during the following season. They also developed a good layer of new wood on their trunks and formed a good crop of fruit buds.

In the case of two year old trees, those that were cut back so as to leave the trunk and spurs of the main branches two or three inches long did best and made fine heads.

One year old trees that were cut back nearly to the original bud and had a single sprout trained up during the growing season made fine trees.

The principal growth took place near the extremities of the parts of the tree that were left after pruning. Trees that were cut back into more than four year old wood failed to grow at all in some cases, showing that in very old wood the buds are too dormant to be easily started into growth. The amount to cut away in renewing winter injured trees requires good judgment in choosing between leaving too much wood (which results in weak growth and too high heads) and cutting back too far into old, dormant wood that will not start new limbs.

Experiments to determine the best time to prune showed that trees that were pruned any time after the severe cold spell up to the time the buds began to start in spring grew equally well.

Good cultivation is of more than usual benefit to peach trees during the spring and summer following severe winter injury.

"That Miss Wadleigh is rather reserved, isn't she?"

"Very much so. I reserved her for life last night."

Jack—So the pretty girls are going to sell kisses at the church fair to help among the proceeds, eh? What will the kisses be worth?

Katharine—Oh, I guess they'll be sold at their face value.

PRUNING.

The practical grower of trees and shrubs is frequently taken to task by the would-be tree protector because he cuts out branches which are neither broken nor dead, but are in a healthy, flourishing condition. The argument used by this critic is that in nature it is not necessary to cut out branches and otherwise mutilate trees; that, in order to allow the plant to assume its natural and normal form, no pruning should be done and that the use of the knife is detrimental to the best interests of the tree, and should therefore be discouraged. The practical grower, however, knows too well the results which follow from this laissez faire method of handling trees in the orchards, parks, and other ornamental plantations.

Under natural conditions plants grow thickly; one crowds upon the other, and in that way all superfluous individuals as well as branches are crowded out. Under artificial conditions there is no such force at work. Plants are placed at distances which prevent this natural pruning. The increased amount of food available to plants under artificial conditions frequently excites growth, so that the distance between the different whorls of branches, which naturally develop from near the end of the growth of each season, becomes great, thus giving the plant an open form and the appearance of having been built by stories. By a judicious use of the pruning knife the gardener shortens this annual growth, thus reducing the distance between the branches formed in successive years, with the results that the tree has a more compact and symmetrical form and therefore is better suited to serve the purpose of an orchard or ornamental tree.

What has been said in regard to the heading in or cutting back of orchard and ornamental trees applies with equal force to shrubs. Care should be exercised, however, in this heading-back process in order that the plant so pruned should not asume an artificial form. The head-in should be a corrective process rather than one which is directive; that is, the heading-in should only be sufficient to counterbalance the augmented growth which results from the increased food supply of plants grown under high culture.

BERRY GROWING.

Permit me, as one of your many appreciative readers, to write a few lines for the Cultivator, for I believe it is but fair and just that someone who has the experience in raising honest berry plants give your correspondent, Mr. Mitting, in a recent Cultivator an item of correction. It is this: His advice and method of raising berry plants, is to take a long-handled shovel and put a shovelful of soil on each tier of cane. I may be pardoned for stating that the writer of this knows from more than 14 years of experience in raising berry plants, that the aforesaid method is radically all wrong.

Say, brother berry grower, you will say, "Well; they'll grow." I answer, "Oh yes, and yield a little income." Let's reason together. We all do, or at least should know that nature's way of growing those same plants is from the tips only. Small wonder that this writer saw fit to plow up his whole patch of Logans, because of so many unproductive vines. I could tell you of some remarkable experiences and observations in the past, along those lines, but the above will suffice.

Now if you care to listen; will tell you how to put down all that class of plants for its no trick at all. Simply take a steel garden trowel, a spade, or light iron bar, in one hand and grasp the vine with the other, then set down the vine and pack the soil 2 inches on heavy soils, and you will grow the finest plants if done not much later than the last of October in this part of California. Will add, that with the spade I myself have put down many thousands of plants, and the beauty of it was that at the end of the job I always know about how many plants there'll be. Will say that I have none for sale whatever.—H. W. Hoit, Garden.

"You see," explained the investigated packer, "we sell what we can and what we can't sell we can and then we can sell it." Which thoroughly explained the situation.

An Abundance of Fruit

of highest quality, finely colored and flavored, is the direct result of supplying a complete fertilizer containing from 7 to 12 per cent. of

POTASH

to the tree, vine or bush.

"Plant Food" is a book well worth a place in the library of any fruit grower. We will gladly mail it to all applicants.

P. K. WOOD'S
Improved Deep Well Propeller Pump
FOR IRRIGATING AND MINING

After devoting several years to deep study and experiments, and the expenditure of many thousands of dollars, this pump has been brought up to the point where it is practically indestructable, has an efficiency not to be excelled, and is ready to try conclusions with any deep well pump on earth. The principal improvement consists of a screw guide inserted in casing coupling and a ball bearing placed in each guide, which gives absolute protection to all parts of the pump, regardless of the amount of sand or grit which the water may contain. Write for catalogue and full description of these important improvements.

TO FARMERS AND DAIRYMEN

It will pay every farmer or every farmer's wife to sit right down and write for Sharples "Business Dairying." This valuable book contains information that can be found in no other book, and will help any dairyman to make his business more profitable. It tells How to Feed, What to Feed, How to Care for Feed, What Foods Produce Greatest Amount of Milk, How to Care for the Dairy Cow in the way to get best results, and the whole book is practical. To get all the good out of your milk you should of course use

THE SHARPLES TUBULAR CREAM SEPARATOR

It is not only guaranteed to more than pay for itself annually, but the ease with which you can skim, the low can, the self-oiling bearings, the simple **Tubular** bowl with only one little part inside to wash, the moderate price, are all points you should know about. Send today for the free "Business Dairying" and full information about the Sharples Tubular, giving number of cows you keep. Ask for booklet G. 260

Mrs. J. Renken, Trenton, Ia., says "We cleared $100.00 in six months off seven cows."

THE SHARPLES SEPARATOR CO.,

Southern Chief DISC PLOWS

MOLINE PLOWS AND OTHER FLYING DUTCHMAN FARM TOOLS

Built with Special Reference to the Requirements :: of PACIFIC COAST Farmers and Orchardists ::

These plows are made entirely of steel, malleable and cast iron. They are well braced, strong and easily controlled. The three disc can be converted into a two disc, and the four disc is easily changed into a two or three disc. A farmer having a two disc can make a three disc by securing the extra parts.

LEVER RODS SLIDE THROUGH ADJUSTABLE CONNECTIONS
Keeping the Levers and Operator Always in the Same Relative Positions.

The location of seat, wheels and hitch are right, giving good penetrating power and permitting of turning to either right or left. The front wheel is under control at all times and the plow can be steered at will.

The Orchard Axle Attachment

with which either size of these plows can be equipped is a splendid thing for orchard plowing, and especially where it is desirable to work up under the branches close to the trees.

Permits of Closer Work than Can be Done with a Walking Plow

The plow with this attachment can be used for general work as well as for orchard plowing.

Made in Two, Three and Four Disc

SIMPLE WITHOUT SACRIFICE OF STRENGTH, AND THE QUALITY OF WORK CANNOT BE EXCELLED BY ANY DISC PLOW AT ANY PRICE

All levers are convenient for the operator, easy to control in raising or lowering plow and for guiding purposes. The bearings are long and made of chilled cast iron, insuring wearing qualities. The foot trip for rear wheel permits the plow to turn either way, and also serves as a raising lever. The method of raising and lowering front furrow wheel is sure to be a source of delight to the operator. It does away with the inconvenient lever in **general use**, which is usually too **long** on a **two disc** and too **short** on a **three disc**. The elasticity of the spring board hitch relieves the plow of dead shock and severe strain.

ASK YOUR DEALER TO SHOW YOU THESE PLOWS

Send us your name and address, enclose four cents in stamps to pay postage and mailing, and we will send you our Flying Dutchman Song Book and Junior Catalogue Combined, containing Twenty-six Old Familiar Songs with words and music.

Live Stock and Dairy

By Mrs. Minna E. Sherman, Fresno, Cal.

Digestion of the Cow

The dairyman rather under feeds his cow, thinking that ten cows paying a small profit is better than having five pay the same profit. For sure, if one dies the loss is not so great! This is like the merchant who sold one year a hundred bolts of cloth at a loss of a dollar a bolt, the next year sold two hundred still at a loss of a dollar a bolt, and then congratulated himself on the increase of his business.

The readers of the Cultivator having one, two, or three cows, that have written to me, seem nearly all disposed to over-feed the cows, with concentrated foods. The Experiment Stations have discovered important truths that the cow feeder should understand, in regard to the amount of food a cow can assimilate, and still remain in vigorous condition.

The amount of concentrated food a cow can use has been demonstrated by careful experiments, as well as the proper proportions of concentrated food to the more bulky ones. Also the necessity of abundant water for cows to soften the food in regurgitation. It has been found that it does not pay in feeding the average cow of one thousand pounds in weight, to exceed eight pounds in their concentrated foods, or, about one third of the required 24 pounds of nurtiment should be in concentrated form and sixteen pounds in the more bulky form of hay or silage.

It takes a superior cow to pay a profit on heavy feeding, the average cow has neither the inheritance or the trained capacity to produce the required amount of butter fat to make it profitable. The consumption of food is not all, it needs to be assimilated. The excessive grain ration is balanced by succulent foods. There is truth in the clumsy expression that grain burns up the cows stomach. Green food, silage, or oil cake will help digest the grain and should be fed when forcing a cow on grain feed. Oil cake will aid a cow to use fifteen to twenty pounds of grain a day for a considerable time without going off her feed. It is not economical to feed these excessive amounts, though it is often done for record making.

The rule for cow feeding is one pound of such concentrated foods as bran, corn meal, rolled barley, oil cake or coconut cake, to two pounds of roughage, such as hay, wheat straw, corn fodder, corn silage, or like materials. Water is used by the cow in the proportion of four pounds for every pound of dry feed she consumes. Watering a cow once, twice, or three times in twenty four hours will result in a loss of milk. A cow must have fresh water at hand all the time, to drink at will. The average amount of water used by cows in milking varies greatly in the different experiments, all the way from eight to twelve gallons in twenty four hours.

The need of water is varied by the roughage the cows receive, those on silage require less than those on hay. Succulency of the silage aids digestion in the cow. Yes! If we only realized it, and used more in our own food we would be better in health. If we would eat two thirds of our food as fruit, green vegetables or salads, to every pound of meat, potatoes and bread stuffs; the use of oils, olive oil in salads etc., is not considered enough on the family table. Many a puny fretful child of tender years suffers from indigestion, as it is fed largely on potatoes and cereals. Olive oil brings vigor to these cases when made a moderate part of the food for six months.

The cow's stomach is often overburdened with a mass of dry matter, heavy grain and woody hay; she cannot manage to digest the mass. Corn silage, beet pulp and brewers grains all increase the milk flow and bring the cow up to a high degree of health. Many feeders cannot obtain these feeds and have no pasture at this season of the year. In my own herd I used to substitute chopped alfalfa hay, wetting it down well and allowing it to stand covered over night. It heats a little. The grain ration was placed on ten pounds of the wet alfalfa chop and fed. The cow should have long hay in the mangers or wheat straw in their racks.

There are dairymen around Fresno that feed the cows entirely on alfalfa hay and wheat straw; the cows are apt to grow thin before the green grass comes in, but they find it pays them to do so rather than to feed bran at twenty four dollars a ton, to cows that cannot make over two hundred and fifty pounds of butter a year.

Barley hay or straw should not be fed to dairy cows. Why? Well I have never failed to find they dropped off in their milk whenever they had any barley hay mixed with the oat or wheat hay. We grow mixed wheat, oat and barley hay for the horses, and try to have straight oats and wheat hay for cows and stallions. Wheat hay does not affect them as quickly, but is not as good as oat hay. Of course none of them equal alfalfa as food for cows.

Of rations we used before we built the silos, the following gave us the best returns: Five and two third pounds of heavy bran, and two and two thirds pounds of rolled barley. When we had it, we added corn, making the barley and corn into a mixture, and taking the two and two third pounds from the mixture, and five pounds of alfalfa hay. Ten pounds of the hay was wetted and chopped to feed the grain on in the mangers. This was the average daily feed per cow; some received a double feed of this, others half feeds. Without chopping and moistening the following was fed: Fifteen pounds of alfalfa hay, seven pounds of shorts, two pounds of dried malt sprouts. By making this ration: four pounds shorts, three pounds bran and adding one pound of oil cake the ration is greatly improved.

THE MANE AND TAIL.

Many a boy or young man on the farm who is anxious to keep his horses looking well at all times often feels discouraged over the difficulty of keeping the tails and manes in satisfactory condition. It is brought home with special force to these when they visit the city and see the condition of the mane and tail of the well kept city horse. Not that there are no horses on the farm that are kept just as well as in the city, but during a day's outing one will see a much greater number of well groomed horses in the latter place.

A writer for the Journal of Agriculture says the trouble is in keeping the tails from getting into what is known as the "lamb tail" condition. This, he says, is largely due to the fact that the hair has not been thoroughly cleaned, so that it adheres in clusters instead of remaining separate, as the hair should. The first thing to be done therefore, is to give it a thorough washing out, after which it should be thoroughly combed until every ringlet has disappeared. An ordinary mane comb may be purchased for 20 or 25 cents, and is absolutely essential. After getting the hair clean it is only necessary to spend a little time with the comb each day. Of course, if the stables are dirty it is almost impossible to maintain the proper condition, but if a reasonable amount of bedding is used there is no reason why every horse should not show a shiny, wavy mane and tail. Nothing is more common than to see the ordinary curry-comb used as a tail comb, and it is scarcely necessary to say that this is a mistake, because the teeth, if the comb is used freely, will cut the hairs rather than separate them .We are fully persuaded that a minute or two spent each day with a good mane comb wil be sufficient time to keep these parts in good condition, and if this is done there is no question but what it adds 50 per cent. to the appearance of an animal.

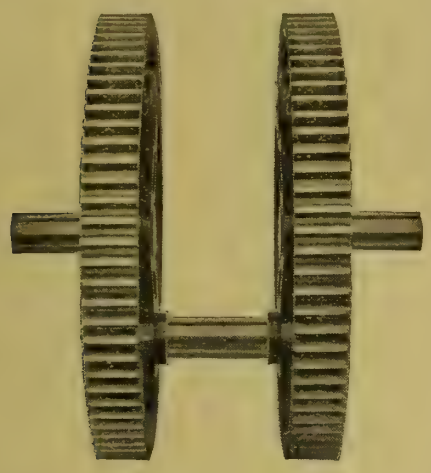
The Pomona Pumps Are Best



for **City Waterworks** and **Irrigation**

BECAUSE—

Using machine cut and slow running gears, they are

PERFECTLY NOISELESS.

They use stepped gearing with no break in the tooth contact, doing away with all rattle and vibration.

BECAUSE—

They have an ideal motion of the pump rods, which consists of a uniform continuous slow up motion, a smooth, quick down movement with absolutely no jerk in starting the rods upward eliminating all rod breakages and valve troubles.

BECAUSE—

They will save you money in cost for power. We use machine cut gearing which alone saves ten per cent. We have a leverage in our gearing which other pump makers do not have and which they do not tell you about when trying to down us.

BECAUSE—

In pumping through long pipe lines, they deliver a continuous steady stream.

They do not hammer out your pipe line by irregular pulsations of the water column.

They save power by keeping the water in continuous motion.

BECAUSE—

They are fitted with improved oiling devices that can be filled without stopping. Pumps may run for weeks continuously.

BECAUSE—

We have advantages in our pumps that investigators appreciate at once, consequently, where one goes others follow and we are fast taking the country.

BECAUSE—

We give a guarantee of satisfaction with every plant.

Send for catalog.

CRAZE FOR SHEEP.

A few hours spent at the Chicago sheep market most any day of the week would convince the casual observer that the country has gone daffy on sheep. To get into the business is the ambition of hundreds who for the past year or two have been reading of the wonderful profits made in sheep industry. We do not want to infer that we deprecate this ambition, but on the other hand feel disposed to say that these buyers woke up too late. Most of them should have been in the business long ago. To buy breeding stock when the tide is running high and competition is fierce is not always the best time, but still we believe that the investment is good, even at current rates. Better by far to get in late than not at all, and it is a good sign that so many are taking kindly to the industry, for a few years ago sheep were not popular with many farmers, and those who had them sold out root and branch. Now that the pendulum has swung to the other side of the arc, all are trying to get in.

The high prices for sheep and lambs may not always last, but it is pretty safe betting that values will not swing back to free trade times of ten years ago.

As long as the public appetite favors mutton, so long will it pay to raise sheep and there will be no danger of getting an oversupply with the quality constantly improving.—

Shepherd's Criterion.

Queries

Abortion in Cows.

I have three cows and two one-year-old heifers that I can not get with calf. They have been served five or six times and are still coming back. They run with sire in pasture, but are taken up as soon as served. The sire served two of my neighbors cows last summer that had aborted and not treated. Do you think it can be the cause? Please let me know what to do and give treatment if any.—A Turlock subscriber.

These questions have been fully answered recently in replies to different correspondents. There can be little doubt that the contagion was transmitted from the sire to these young cows. If these cows have any discharges it will be useless to breed them until all inflammation has subsided.

If discharges ever so slight are present, wash the cows out daily with warm water adding a tablespoonful of lysol to each gallon of water used. When cured use the yeast treatment as directed in the last Cultivator.—M. E. S.

Indigestion.

Please tell me in your next paper what makes my cows bloat on dry feed. I feed alfalfa & pumpkins, bran & corn-meal. The hay was cut when some of it was beginning to bloom. Some of them bloat every day and have for a month, Yours truly.—J. P. S., Lordsburg.

Cows bloat on dry feed from indigestion caused by lack of succulency in the ration. This is usually the case, and can be remedied by giving them the bran moistened. Also see that they have water at hand at all times. Then sweeten their stomachs by the use of baking soda. Add a heaping teaspoonful to the grain feed of each cow. When feeding dry food, if the price is not unreasonable, a handful of oil cake meal added to each cows food will greatly aid her digestion of the dryer foods.—M. E. S.

What Is a Good Slop?

Can you give me a good ration for hog slop?—J. P. R., Bakersfield.

Corn meal and heavy wheat middlings made into a slop are much better and eaten with greater relish by hogs than an exclusive meal slop.

Best Way to Wean.

What is the best time to wean pigs?—L. M., Azusa.

The best time to wean pigs is to begin as soon as they will eat solid food.

Now is the time to go for gophers with

Bille's Gopher Poison

The Gophers will go for it and it will go for them good and plenty every time

This is a photo of 201 killed in one day on a ten acre field before they could get back to their holes, with one bottle of BILLE'S GOPHER POISON

Endorsed by Agricultural Colleges and Experiment Stations. Not one of the ordinary poisons, but in a class by itself. Has had greatest success in the Middle West. The secret being that it is most attractive to gophers, squirrels, etc., and sure death to them. It gives the grain a glossy coating, retaining the poison for weeks. Hundreds also die in their holes by eating it there. We have bought the patent rights for this section and are selling at the eastern price of $1.25 for large bottle. The ingredients cannot be bought at a drug store for that price. Money refunded if not as represented—so printed on the bottle. If your dealer does not keep it, send $2.50 for two bottles, express prepaid by us. Any way send for circular with affidavit of above killing and a few out of many testimonials.

Send us the names of twelve persons who keep poultry and we will send you FREE "The Poultry Manual," by those high authorities, F. L. Sewell and Ida E. Tilson, profusely illustrated.

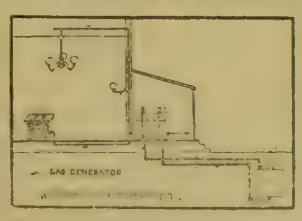
WESTERN GAS GENERATORS



Write for pamphlet to

The most reliable and cheapest GASOLINE GAS GENERATOR ever put on the market.

AUTOMATIC SAFE ECONOMICAL.

Read what Mr. A. W. Foster, President of the California Northwestern Railway has about them:

Gentlemen:

Replying to yours of the 20th inst., I would state that the plant installed for me by the Western Gas and Power Company, on my Hopland Stock Farm, is giving entire satisfaction, and I cannot speak too highly of it. Yours truly, A. W. Foster.

Mr. Foster used an acetylene gas generator before we installed our Western.

WESTERN GAS & POWER CO. 1842-48 Seventh St., Oakland, Cal.

20 Reasons
WHY THE
Addison Pump

Is Better Than All Others

1. It will pump more water with less power.
2. It is more substantially constructed.
3. Has no overhanging bearings to spring and cause friction.
4. Absolutely uniform—does not break rods.
5. Plunger leather can be changed with less trouble and expense.
6. Water discharge in continuous stream—no pulsations.
7. Noiseless in operation.
8. Has no jar or hammer.
9. Perfectly balanced, no braces are required to keep pump in position.
10. Will be in good working order when other pumps with erratic or variable motion are in the scrap pile.
11. The frame contains within itself the main bearings, which are unusually large.
12. The cranks consist of three gearwheels, pinned on opposite sides, thus forming a double crank.
13. The outside gears are shrouded on the inside and the center gear on both sides. The pinions are placed on two counter-shafts in main frame in such a manner that the shrouds of the gears rest on the shrouds of the pinions, forming a bearing to carry the load when pumping, and thus keeping the teeth in proper mesh, giving the greatest strength and least wear and distributing the weight over six boxes.
14. The pitman rods are of the same length and are forged from one solid piece of best machine steel.
15. The driving and counter-shafts have only 22 inches between the bearings which carry the load, and with the size of shaft used makes it impossible to swing out of line, under the heaviest of work.
16. The cross-heads are planed and fitted with tempered brass strips made to fit groves in columns; so arranged that wear can be taken up.
17. Both pump rods are fastened to the cross-head pins, so there is no pulling strain on the cross-head proper.
18. By our specially constructed couplings, rods are as strong at joints as at any other part.
19. The Addison Patent Straight-Waterway Valves offer a free passage for water, causing less friction than in any other valve.
20. Pump can be operated without a stop as the following testimonial proves:

Addison Pump Co.,
Pomona, Cal.
Gentlemen:—
In reply to your inquiry of Dec. 24th., I am glad to say that your pump has now worked steadily for over two years with entire satisfaction.
As far as I can recall it has never had to be repaired, and has never missed a stroke.
Very truly,
J. H. McBRIDE.
Pasadena, Cal., Dec. 28, 1906.

If you will come to Pomona and spend a day with us we will show you our pump and other pumps in operation, then leave it to your own judgment to select the best.
We give an iron clad guarantee with every plant.

CREAMERY VENTILATION.

Creamery ventilation, like all other ventilation, involves the removing of the air in the building and the introduction of fresh air to take its place, writes A. Slaughter, in the New York Creamery Journal. The question then resolves itself into how we can most effectively and economically change the air in the creamery.

We should remember that force must always be applied, whether we use the warm air flue, or, as it is sometimes termed, natural draft, or the mechanical forced air current; and also that force always costs. The system of ventilation may be most effective and yet be so costly in operation as to preclude its use. On the other hand, a system may be economical, but lack entirely in efficiency. We must, therefore, seek a method that will be both affective and economical.

In the average creamery, where the machinery is in operation a part of the time only, mechanical ventilation lacks in efficienty, as ventilation stops when the fan, which must be operated by the engine, stops. But where the plant, like some of the central creameries is operated all day, or where an electric motor may be used, mechanical ventilation by means of the fan and properly arranged flues becomes the ideal system.

To over come this defect in the average creamery, I would install a system combining natural draft with mechanical ventilation.

It is, of course, impossible to give a definite plan without knowing something of the plan of the building and its equipment. We may however, suggest some general ideas.

Where overhead space is not to be utilized for an upstairs, I would build the ceiling in shape that the warm air and vapor would concentrate at one point. At this point I would place a discharge ventilating flue. This flue would also have a branch extending down close to the floor and so constructed as to be easily closed or open at either the ceiling or floor opening. I would also provide the flue with fan and such connections as would enable me to use the fan when machinery was running and natural draft when machinery was idle. The intake air flues should be so arranged as to temper or warm the air in cold and cool it in warm weather. It will be necessary to have two sets of these flues. The warm air should discharge near the ceiling but at some distance from the discharge flue, while the cold air flue should enter near the floor. The cold air duct may well be a subearth duct, but if this is not advisable, it may be carried through the icehouse or refrigerator, while the warm air duct may be carried through the boiler room or in contact with heat anywhere. In operating a system of this kind, it should never be allowed to enter the creamery when the room is filled with steam or vapor, as the cold air will condense the moisture and cause it to settle on the walls, ceilings, or other surfaces exposed to it. The violation of this rule is the cause of much of the dampness and moldy conditions found in many of the modern creamery plants.

Keep the warm air coming in and the warm, moist or vaporous air going out until the vapor is all out and then allow either warm or cold air to enter as may be desired. If the warm air is allowed to continue to flow in for a short while after evidence of moisture has disappeared it will be all the better.

A system planned as here suggested and properly operated will always prove efficient.

I would have natural draft flues so constructed as to produce good, strong draft. And in case they should fail to operate, place a steampipe in them, thus warming the air and causing it to rise. However, if they are properly built, there will be no need of the steampipe. This testing is simply an application of the principle of Prof. King's system of cow barn ventilation.

"Yes," said the warden, "he was the coolest and most thoughtful convict who ever broke jail.

"You don't say?" exclaimed the visitor.

"Yes; he left behind him a note to the Governor of the State beginning: 'I hope you will pardon me for the liberty I'm taking.'"

PROTECT BIRDS AND ANIMALS.

A bill for the protection of animals, birds and fish in the forest reserves in California, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the President of the United States is hereby authorized to designate and from time to time modify the boundaries of such areas in the public forest reserves within the State of California, as should in his opinion be set aside for the protection of game or of other animals, birds, or fish, and be recognized as a breeding-place therefor.

Sec. 2. That when such areas have been so designated as provided for in section one of this Act, hunting, trapping, killing, or capture of game or of other animals, birds or fish upon the lands or in the waters of the United States within the limits of said areas shall be unlawful, except under such regulations as may be prescribed by the Secretary of Agriculture, and any persons violating the provisions of this Act shall be deemed guilty of a misdemeanor, and shall, upon conviction in any United States court of competent jurisdiction, be fined in the sum of not exceeding five hundred dollars or be imprisoned for a period not exceeding six months, or shall suffer both fine and imprisonment, in the discretion of the court: Provided, That the Secretary of Agriculture may, when necessary, authorize the capture therein of animals, birds or fish for propagation, may authorize fishing with hook or line, may permit the collection of specimens for scientific purposes, and may exempt from protection and destroy such species as he may deem injurious. Provided, further, That this Act shall not give protection to such birds or animals as are or may hereafter be declared injurious by the laws of the State or Territory in which such reserves are situated.

Sec. 3. That it is the purpose of this Act to protect from trespass the forest reserves in the State of California and the animals, birds, and fish which may be thereon, and not to interfere with the operation of the local game laws

(Mr. Smith, Chairman of the Committee having charge of this bill (which has been reported on favorably in both the Senate and House) can push it to final passage without delay, but he first desires to be convinced that there is a strong popular approval of it.

(Will you, in the interest of saving the remnants of a few valuable species now scattered, and pursued to the border line of extinction, write to Hon. S. C. Smith, House of Representatives, Washington, D. C., urging the passage of said Bill at the present session of Congress.)—Editor.

SOLD FOR TEN THOUSAND DOLLARS.

"The Syracuse, N. Y. Herald, of December 9th, reports the sale of the young Holstein bull, The Milk and Butter King, (whose picture was printed on page 959 of the current volume) by Mr. C. S. Averill to Messrs. Crouse and Brockway, for use in the herds of the former at Homer and of the latter at Auburn, both in New York. The price paid is said to have been an even $10,000.

This bull is a descendant of two famous western animals. His sire was a grandson of Johanna Aaggie's Sarcastic Lad, bred and owned by Gillett and Son, at Rosedale, Wisconsin, and his dam was Mercedes Julip's Pieterje, bred by Alfred Wilkins, Galt, Ill., and making the astonishing record of 23½ pounds of butter fat in seven days in an official test for Mr. T. S. Tompkins, at White Bear Lake, Minn., who purchased her of Mr. W. R. Gates, of our neighboring town of Oakland, who for some years has had another of her sons at the head of his heard."

—Hoard's Dairyman.

We are pleased to state that the Mr. Tompkins mentioned in the above article is now a Californian and is engaged in business in this city being President of the West Coast Stock Food Company., whose advertisements appear in this paper. From the quality of the "West Coast" goods that this company is turning out and from its largely increasing trade, it would seem that he is giving the same skill and attention to the manufacture of stock and poultry foods that he must have given to the care and feeding of his live stock back in Minnesota.

The Vegetable Garden

By ERNEST BRAUNTON

CUCUMBERS FOR EARLY MARKET

IN CERTAIN localities along the Atlantic coast special types of the trucking industry have been developed. One of the most interesting phases of this development is found in the methods employed in bringing the cucumber to marketable maturity.

While in most localities cucumbers can be successfully grown in the open ground, in some situations it has been found advantageous and very profitable to go to the expense of starting cucumbers under glass in cold frames, and developing them in this situation until they fill the space covered by the frames, after which time, if weather conditions are favorable, the sash and frames are removed and the plants are allowed to occupy the entire area.

This branch of the cucumber industry is frequently combined with the cultivation of lettuce and is carried on in much the same way that the lettuce and cucumber industry is conducted in the great forcing establishments in the neighborhood of Boston and other northern cities. The growing and marketing of early cucumbers in this state. as described in this department a few weeks ago has proven very renumerative in many parts of the state Early cucumbers always command a good price in the markets of San Francisco and Los Angeles and somewhat in demand at many lesser points.

COMMERCIAL MUSHROOMS.

The successful cultivation of mushrooms in America has not been so general as in most of the European countries. It is in France and in England that the mushroom industry has been best developed. France is, properly speaking, the home of the present mushroom industry.

Unusual interest has been shown in the United States in the growth of mushrooms within the past few years. and it is to be hoped and expected that within the next ten years the industry will develop to the fullest limit of the market demand.

The latter will, of course, be stimulated and developed by the increasing popular appreciation of this product. In some cities and towns there is already a good market demand for mushrooms, while in others they may be sold only directly to special customers. This should be borne in mind by prospective growers.

GROWING ONIONS.

The Texas Station has made a study of the comparative economy of hand culture and horse culture and of bed and field planting of onions with the following results:

"Hand culture with onions was more profitable than horse culture. Planting seeds in beds and transplanting to the field, with either hand or horse cultivated onions was more profitable than planting seeds in the field. It cost less (where labor ranged from 50 cents to 75 cents per day) to grow an acre of onions to maturity by planting the seeds in beds than by planting in the open field."

The New York State Station has recently made an interesting and valuable contribution to the subject of the fertilizing of onions. It was found that in certain market gardening regions, notably on Long Island, commercial fertilizers are frequently applied to onions at as high rate as a ton of high-grade fertilizer per acre.

The investigations of the station, while not conclusive as to the exact amount which it is most profitable to apply, which of course varies largely with the condtions of soil, season, etc., show quite clearly that the present practice supplies an amount of plant food far in excess of the needs of the largest crop, and is therefore wasteful.

"Considering the varying price of the marketable product, the close margin of profit from heavy manuring with fertilizers even with fairly good prices for the crop product, and the vicissitudes of the crop due to the limitations of season, the onion grower runs great risk of dimnishing profits when he uses 1500 and 2000 pounds of commercial manure per acre."

When writing advertisers mention Cultivator

CONTROL POTATO DISEASES.

Potato planters should avoid planting those varieties of potatoes that have a special tendency to disease. There is a great difference in varieties in this respect.

The soil of the older potato growing sections is apparently badly infested with the germs of potato rot, which will probably be troublesome every year, and in exceptionally cool, wet years, like that of 1904, it will cause serious injury.

It will probably pay potato growers, in sections where potato blight and rot have been especially abundant the past year, to spray their potato vines at least three times with Bordeaux mixture, beginning when the vines are about six inches high and repeating once every two weeks. The aim should be to keep the entire vine well covered with this mixture so as to render it immune to the germs of potato disease. There are a variety of spray pumps adapted to this purpose. Most of the pumps that work best for applying Paris green in water are adapted to applying Bordeaux mixture. They should have all parts made of brass or copper.

Paris green may be applied in Bordeaux mixture without additional expense and with satisfactory results.

CELERY BLIGHT.

While the weather conditions are important factors in producing celery blight as well as all other fungous disease, it is true that no fungus disease will be produced unless the spores of the particular fungus that produce the disease in question are in contact with the plant and capable of germinating. Hence if the spores of the blight-producing fungus can be kept away from the plants or kept from germinating, the blight will not be produced whatever the weather conditions may be. In combating this disease, therefore, it is necessary either to produce those conditions under which the spores of the fungus cannot come into contact with the celery leaves, or to bring about those conditions under which the spores are unable to germinate.

STRAWBERRIES FOR HONOLULU.

The Cultivator is always pleased to chronicle testimonials touching the reliability of its advertisers. We have before us a letter from Mrs. Charles M. Cooke, of Honolulu in which she says: "You may be interested and also pleased, to learn that a shipment of strawberry plants which I ordered From Mr. G. H. Hopkins, of the Fairview Farm Nursery, Burbank, California, reached me in fine condition and appears in every way satisfactory,"

When shipments so far from home are proven satisfactory as to quality and condition received, home customers need have no fear as to the reliability of the shipper.

TOMATO CULTURE.

The results of this season seem to show that there is but little difference between the period of ripening of tomato plants that are pruned and trained to stakes and of those that are allowed to grow on the ground in a natural way, and consequently no profit from the operation of pruning. But these results are contrary to the experience of some of the most practical men, and should not be thought conclusive.

SUGAR FACTORY.

At the Los Alamitos sugar factory the Osmose run still continues on molasses from the season's best campaign. Several hundred thousand pounds of sugar will thus be added to the season's output.

At the same time the big sugar mill is being put in first class shape to handle the beets from 7000 acres and the present outlook makes it appear that it will be taxed to its utmost the coming season.

It's a poor scale that hasn't two weighs.

Piles Cured In 6 To 14 Days.

PAZO OINTMENT is guaranteed to cure any case of Itching, Blind, Bleeding or Protruding Piles in 6 to 14 days or money refunded. 50 cents.

If the dealers would only be fair to you and me, you would have less lamp troubles and I would make more chimneys.

If a MACBETH lamp-chimney was sold every time one is asked for, I would make all the lamp-chimneys instead of half of them.

The Index explains how to get a MACBETH chimney to fit every lamp, and how to care for lamps. Sent free to everyone asking for it.

With the Citrus Growers

By J. W. MILLS

EXPERIMENTAL WORK WITH ORANGES.

DURING the last dozen or more years the Department of Agriculture at Washington, D. C., and the State University, have been petitioned by the orange growers of Southern California, to carry on experiments along various lines of citrus culture in the South. It has been only within the last two years that any definite results in inaugration have been attained.

The first important research that was of direct benefit to the growers was the work done in connection with investigations of the causes of decay of the fruit in transit. This was under the direct control of Mr. G. Harold Powell of the United States Department of Agriculture.

The efforts of the growers in producing fine groves and fruit came to naught when the fruit arrived in the East with such an amount of decay that the profits were gone. But the evil did not stop there. Into the bad bargain was injected the disagreeable feature which gave the California product a bad reputation. This brought on more trouble for it gave fruit buyers in the East an excuse to cut prices. This feature was emphasised by an example of a particular grower who packed and shipped his fruit by certain methods, which landed the fruit in the Eastern market in as good condition as when it left his packing-house. One buyer handled this entire product and was glad to pay often as much as several dollars a box more for it than for some other fruit that was just as good as when taken from the trees. All the causes which were responsible for these differences, were hunted out by Mr. Powell and cases where the managers thought they were extremely careful, it was found that over one-third of the fruit bought into the packing-houses on some days was beyond the help of any power to save it, due entirely to minute injuries inflicted by pickers. It is true that managers of some packing-houses had repeatedly called attention to the fact that the fruit was not properly handled before being taken to the packing-houses, but these complaints fell on deaf ears and it was not till a Federal expert presented figures that any heed was given by most of the growers. This work resulted in the reduction of loss of fruit in some cases from over 30 per cent. to as low as 4 per cent. or 5 per cent.

At the same time the services of the State University were enlisted through a special act of the Legislature, to investigate certain problems, which will take years to work out. The work of the Federal department was confined to the finished product, the fruit after it had matured. It must reach definite results within a few months after entering the work or all its efforts would be lost. Nevertheless, it required an expert with certain qualities to back him to do this work. The work that devolves upon the State Department is of a wider nature, taking in a great many branches and requiring men of different qualifications. The State has taken the work that begins with the antecedent of the seeds, which produce the material with which they are to work up through the life history of the plants. This will involve selecting trees for seed parents, to selection of pedigreed stock for buds, growing them on various kinds of soil under various conditions and in short, studying all the various features of the industry as they are presented to the grower. This will deal with young groves, old groves going into decline and all the problems that lie between the extremes.

Two years ago, fertilizer experiments were started on a co-operative plan with the growers of the South. At the beginning at attempt was made to collect data that might serve as a guide for the work, but it was found impossible to secure anything of value in the line of fertilization of groves, as no accurate records could be found where the application of fertilizers had been systematically carried on with subsequent records of results. It was therefore necessary to begin at the bottom and carry the work on for a number of years. Series of plots covering the essential points were laid out in the principal orange growing districts of the South, covering about 150 acres. This area was considerably reduced, but nearly all the districts are now represented. These experiments are now entering the third season and definite results may be expected in a few years.

The pathological work has progressed rapidly with some of the diseases that have shown up and a constant lookout is maintained for new troubles and in this important branch of work, trained specialists are employed.

THE MANDARIN GROUP.

Many writers on citrus fruits have placed the mandarin oranges under the species, Citrus Aurantium Linn. Others have considered it a variety of that species while some, believing it possessed distinctive, specific characteristics have followed Lourerio and have referred it to his species Citrus nobilis. In this latter view the writer concurs, and after a careful study of the matter has placed the whole group under that species, the citation of which is as follows:

The group as represented in Florida is distinct in habit of growth and in fruit from C. Aurantium. It may shade off into the first named species but where such is the case any variety in question should be relegated to the group of which it possesses the greatest number of marked characteristics. In illustration of this,—in the writer's opinion Tangerona, classed with the mandarin group in the catalogue of the Florida State Horticultural Society and in Bul. 8, U. S. D. A., Div. Pomology, should be cut out of that group and placed with the sweet oranges where it doubtless belongs. It probably contains some traces of the mandarin strain but if the specimens which have been examined were true to name, and there is every reason to believe that they were, its affinities are decidedly with the sweet oranges.

The reasons for adopting the group-name Mandarin are, that it has been longer in use and is probably more widely known than any other. Many have referred to the Tangierines as a group or sub-group distinct and separate from the Mandarins. There may be reasons of greater or less weight for this division, but in this publication the name Tangierine has been discarded in favor of the older name. No distinction can be made between the Mandarin and the Tangierine oranges so-called, more than can be made between any two distinct varieties of fruits in recognized pomological groups. Moreover, the fact must not be overlooked that in some of the world's citrus growing districts the two names are used interchangably.

Two explanations have been given for the name mandarin as applied to this group of oranges. It was given either be cause the fruit was regarded as the best of the citrus family, just as the Mandarin or grandee stood in social rank above his fellowmen, or because this orange was the fruit of the rich and therefore only within the reach of the nobility. The fact that the fruit is extensively cultivated in China and Japan and that it is there held in such high esteem leads to the belief that the first explanation is the more correct one.

One other name, "Kid-glove oranges," has been applied to the group. In explanation of the origin of this name the remarks of the late E. H. Hart are self explanatory. "The term "kid-glove" oranges as applied to Citrus nobilis, originally a joke of our facetious countryman, Colonel Dancy, of Orange Mills, was gravely accepted as a synonym by our first nomenclature committee, and like many another whimsical what-do-you-call-him, it struck where one more dignified would have glanced off." Hume

Citrus Deciduous Ornamental TREES Vines Palms Roses

And Every One True to Name

When you buy goods of any kind you of course find it to your interest to do business with an old established firm that has made a reputation for itself by selling dependable goods. Growing trees is no difficult matter, but to have them true to name requires great care and a thorough knowledge of the business, brought about by years of hard work and close application. We strive to give our customers, both old and new, square treatment and never to make any misrepresentations.

WE ARE UNIVERSAL PROVIDERS FOR ORCHARDS AND GARDENS.

We do not confine ourselves to fruit trees alone, but grow also an immense assortment or ornamental trees and shrubs, climbing and trailing plants, palms for house decorations and outside planting, roses in tree and bush form.

CITRUS TREES.

If you want an assortment of varieties we can supply you with the leading kinds of Oranges, Lemons, Pomelos, Limes, Citrons all grown in the great Thermal belt near Exeter, Tulare county.

GRAPEVINES.

On their own roots and grafted on Phylloxera Resistant roots. The largest stock and the most complete assortment on the Pacific Coast. Let us figure with you on your requirements. It will be worth your while

APPLES AND PEARS.

All standard sorts, budded and grafted on whole roots. No piece roots used.

CHERRIES.

A magnificient stock of standard varieties. Bing, Black, Tartarian, Lambert, Royal Ann. As money makers they lead.

APRICOTS PEACHES NECTARINES.

We have a good supply, but stocks are becoming depleted fast. If you contemplate planting this season put your order in now. Don't delay. This is good advice to follow.

ALMONDS.

The new variety Jordan. The leading sort in Spain. Also the standard Hatch seedlings: Drake's Seedling I. X. L., Ne Plus Ultra, Nonpariel on peach and almond root. Our supply is limited with a demand more active than ever before.

Calimyrna Figs

Our Great Specialty

None genuine without our seal

We also have a fine stock of

White Adriatic Mission

and other standard sorts of figs

CHESTNUTS. PECANS.

The most complete line on the Pacific Coast. Best grafted sorts and trees grown from selected seeds.

WALNUTS.

No fruit where conditions are favorable have paid such big returns as walnuts. We have a fine stock of the standard sorts in seedlings and grafted trees.

OLIVES.

In Italy, an olive grove is considered as valuable as a gold mine. The manufacture of Green and Ripe olives and Olive Oil, is now established on a firm footing in California, and a grower with a good grove is reaping a harvest from his olives. Our assortment of the leading oil and pickling varieties was never better.

BURBANK'S CREATIONS.

For the first time we are offering four of his latest and best creations. SANTA ROSA PLUM, RUTLAND PLUMCOT, PARADOX AND ROYAL WALNUTS. Write for illustrated pamphlet telling all about them.

CATALOGUE AND PRICE LIST.

Our new catalogue is the finest book of its kind ever gotten out on the Pacific Coast. It is a compendium of valuable information and should be in the hands of every fruit grower and lover of the beautiful in nature. We also print a catalogue in Spanish. Catalogue and price list mailed on application.

CLEAN CULTURE.

The practice of keeping the ground on which the orange grove stands perfectly free from herbage and thoroughly cultivated throughout the whole year, has been indulged in by many and is still followed by some. This method has nothing to recommend it.

A soil so treated soon becomes depleted of its natural fertility and the humus soon becomes used up through constant cultivation and the application of various fertilizers. No amount of fertilizer will do the work it should, if the soil once loses its natural body and becomes deficient in humus. In spite of every effort in the line of fertilizing, such a soil will become poor and infertile; the trees will soon show the effects in their unhealthy condition, and the owner will realize it in his diminishing returns.

If clean culture is adopted, humus must be supplied in some way, and the plan used by a number of growers in hauling in manure and other vegetation, turning it under, and then allowing the winter's rains to wash it away again does not commend itself to the Cultivator as being the best practice. In passing through some of our citrus-growing districts during the past month we have noticed that clean culture is still practiced by some. One orchard in particular, on rather light soil, showed only a surface of gravel, the finer, humus-carrying parts of the soil having gone down the wash.

Added to this soil depletion was a goodly quantity of soil of all kinds, the loss of which was manifested by the numerous small channels and a few seriously large ones which were to be seen in all parts of the orchard. Such work will never bring an orchard into first-class condition.

THE KUMQUATS.

The introduction of the kumquat into Europe appears to have been quite recent. Gallesio seems not to have known it. Risso and Poiteau make no mention of it in their exhaustive work, "Histoire et Culture des Orangers." Since none of these writers refer to the kumquats, we are safe in concluding that they were not growing in Europe at the time they wrote. So far as the author has been able to find out, the kumquat was introduced into Europe by Mr. Fortune, a collector for the London Horticultural Society, who brought it with him from China to London, May 6, 1846. The oblong variety appears to have been the only one introduced by him, for in his remarks, published in the Journal of the London Horticultural Society, page 239, 1848, he says, "The fruit ripens late in the autumn, being then about the size of a large oval gooseberry." Very soon afterward specimens of the kumquat must have been forwarded to America. A. J. Downing in his Horticulturist of February, 1850, pages 375-377, gives a description of the variety Nagami with illustrations and quotes largely from the remarks of Mr. Fortune. He further makes the following statement: "We have a small tree growing on our own grounds, which was kindly sent us by Mr. Ranch, exotic florist, near Greenwood cemetery, Brooklyn. We believe Mr. Buist, of Philadelphia, and probably other men, now have it for sale, so that amateurs can make trial of it in various parts of the country." Some time later, probably very shortly after this date, it was brought to Florida. Since then several importations have been made by various nurserymen. The original trees imported by G. L. Taber, of Glen St. Mary, in 1885, were still standing in his grove in the autumn of 1901. Reasoner Bros., of Oneco, imported the variety Nagami in 1885 and the Marumi in 1890 from Japan.—Hume.

"THE FARMERS' FRIEND."

This is the title of a neat little booklet full of good things for the farmer. Though sent out as an advertisement, there is so much of real help in it that we do not hesitate to say that it will pay every farmer in the state to send for one—read it we know he will. It is splendidly printed on the very best of paper, a real artistic get up. Send in a request for one to The Pacific Guano and Fertilizer Company, 24th and Indiana Sts., San Francisco.

"Why do some husbands call their wives 'Duckie'?"

"Because they develop large bills."—

Contents

THE SMYRNA FIG OF COMMERCE, 73.

SOUTHERN CALIFORNIA GROUND WATERS, 75.

DECIDUOUS FRUIT CULTURE.—Orchard Fertilizers; Pruning Peach Trees, 76. Pruning; Berry Growing, 77.

LIVE STOCK AND DAIRY.—Digestion of the Cow; The Mane and Tail, 78 Craze for sheep; Abortion in Cows; Indigestion; What is a Good Slop; Best Way to Wean, 79. Creamery Ventilation, 80.

THE VEGETABLE GARDEN.—Cucumbers for Early Market; Commercial Mushrooms; Growing Onions; Control of Potato Diseases; Celery Blight; Strawberies for Honolulu; Tomato Culture, 81.

WITH THE CITRUS GROWERS.—Experimental Work with Oranges; The Mandarin Group, 82. Clean Culture; The Kumquats, 83.

EDITORIAL.—Good Roads Movement; California Harbors; Serious Problem; A Vegetable Doctor, 84.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST.—Newsy Notes from Northen and Southern California, 85.

PROFIT IN THE POULTRY YARD.—Helps and Hindrances in Getting Eggs; Alameda Poultry Show, 86. Honolulu Poultry Show, 88.

THE ORNAMENTAL GARDEN.—Common Names; Grass; Native Ornamental Plants; The Bamboos, 89.

CALIFORNIA HORTICULTURALLY.—The Eucalypti; Conquering the Pear Blight; Establishing the Parasites; Peach Blight; About Vineyard Stakes, 90.

QUERIES AND REPLIES.—Sign Your Name; Early Willard Potatoes; Soil Erosion; Pollination; Unsatisfactory Oranges; Cement Test; Water Glass, 91.

HOUSEHOLD DEPARTMENT.—Sometime, (Poem by Eugene Field;) The Teacher and the Rustlers; Good Driver in Bad Place; 92. Shipwrecked Life; The Life Saving Service; Denatured Alcohol, 93.

THE PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Eastern Citrus Markets; California Citrus Shipments, 94.

GOOD ROADS MOVEMENT.

The Cultivator rejoices that the movement for good roads, which it has advocated strenously for four years past gives promise of bearing fruit.

The Cultivator has insisted that the one thing California lacks to make it the Mecca of the nation for tourists, is good roads. In every other respect the state stands foremost, in climate, people and products. The serious drawback to our growth has been, and is our antiquated road law, which is worse than no law at all, because it does not reach conditions as they exist today and stands in the way of improvements, which might be made by private parties, or syndicates, seeking to better local conditions.

The movement started in Pasadena to vote $3,000,000 to improve the public highways in Los Angeles county is deserving of general and hearty support. The lot would amount to less than 90 cents on each $1000 of taxable property in the county, and it would add five or six times that sum to the value of every acre of land and every foot of realty in towns and cities of the county.

We talk about correcting wrong impressions, which exist in the East concerning California, and to do this we spend money advertising. We keep a development society, with high salaried officers, pounding away for contributions to controvert the erroneous impressions set afloat about California by disappointed tourists. This is money extended for nought. These representative people come here from every section of the country, and from states where good roads exist; they mire in our streets; find our country roads impassible can not tour the country in automobiles or carriages; the very thing they came to California to do, they become disgusted with the whole state and they do it more damage in telling of its shocking streets in the cities, and its bottomless roads in the country, than all the advertising we can do for years will overcome.

What we want to develop in California is a system of good roads. We want a just law that will raise a road tax, then administer it honestly and California will take care of the rest.

CALIFORNIA HARBORS.

We trust Congress will cut out politics and get down to business pretty soon, so that the river and harbor bill may receive due and immediate attention.

This bill has not yet come out of the house committee having charge of it; but it is practically agreed upon, and as presented to the house it will provide for an expenditure of approximately seventy-two millions of dollars. This will be the biggest river and harbor bill ever presented; but there seems to be a notable lack of the old-time references to graft of Congressmen in the bill. Perhaps the river and harbor bills themselves have improved in the passing years. Perhaps the temper of the country respecting them has changed. Certainly the importance of the country as a whole of its internal waterways and of its potrs of entry has been greatly increased.

California is especially interested in the harbor end of the bill, for along the coast are two or three points which may be improved to the advantage of the entire state. San Francisco bay needs money to enlarge its ship docks, San Pedro harbor needs a mint of money to make it a desirable port of entry. San Diego also needs assistance. These harbors are the vital outlets to California's foreign trade and as they are improved and enlarged the whole state will profit. Our delegation in Congress has the opportunity to do splendid work for the state in taking care of its harbor interests.

SERIOUS PROBLEM.

A subscriber of many years writes the Cultivator to ask, "what are we farmers going to do if the Mongolian laborer is denied us?" We frankly answer, we do not know. This question of help on the farm is one of the most serious problems today before the country, for, upon the agricultural prosperity of the land depends the financial and industrial success of the people.

But this problem of farm labor is not confined alone to California. Every section of the country feels it, both within the house and out of it. As much does it trouble the housewife as the man out of doors. There used to be conditions which were helpful to the farmer, but they have passed away. For instance, after the war, for a good many years, ex-soldiers could be found, in every community, who were willing and glad to work during harvest time, or at any time work along their line might he slack. Then too every apprentice claimed and was allowed two weeks in harvest, glad of the opportunity to earn extra pay, while the farmer was equally glad to secure his lusty, youthful vigor and cheerfulness. Whenever a carpenter or a blacksmith, a stone mason or a bricklayer lived in a rented house, and that house was owned by a farmer, there was pretty sure to be inserted in the lease a stipulation that the tenant should work for his landlord two weeks in harvest.

Besides these helps college boys and girls went out to the farm during vacation and most of them proved valuable assistants. By these and other means the farmer secured help in the vital period of the farm work, and in the other seasons he was often able to secure aid from among the surplus sons of neighbors, often themselves farmers. But the apprentice system itself is now in its decadence, while the few young men who are still willing, and are yet afforded the opportunity, to learn trades, would scorn to work in the fields in harvest or at any other time. Tenants no longer bind themselves to work for the landlord, and as for the surplus boys, they have hastened away to the towns to live in mean, stuffy little rooms, and to earn a precarious living at drudgery far more irksome than that which they left home to avoid.

Girls too, consider it bemeaning to work with their mothers on the farm and so become clerks in stores and offices at starvation wages. We know a farmer who has two strong boys and two big girls, all of whom have left the farm and have gone to town. The father and mother work along as well as they can, half tending the place, but it isn't producing what it should because it isn't tended.

But what are these old people to do?

In their desperation farmers nowadays are often compelled in the seasons of stress to hire tramps off the road, and in addition to getting in this way inefficient help, they often take into their homes thieves who rob them and decamp at the first opportunity. This is such a common occurence that scarcely a day passes without a record in the daily papers of farm robbery, either of clothing and valuables or a team. We believe the most efficient remedy for this undesirable condition of affairs, is a return to the old and reliable system of tenantry. Let every farmer provide a cheerful, neat and well-situated dwelling surrounded by yard and garden, in which he may install a decent, industrious man with a family, the larger the better, if they are the right sort, and sufficient help both in the fields and for the women folks may be reasonably assured. A married man is much more stable than a single one, and if he is further anchored in a cozy, cheerful home, with the privileges of a cow and chickens, and the occasional use of a horse, and the liberty to take his children to school in bad weather, he is likely to remain on year after year and prove a satisfaction to himself and to his employer.

If we are to be deprived entirely of Coolie labor, on the Pacific Coast, our crops will be lost, our gardens wasted, our vineyards destroyed,. In short we shall practically cease to be a self-supporting State. But while this will be true of California and the coast, it will also be true of every other section of the country. Truly the out-look along agricultural lines in this direction is not the most encouraging. We had better return to the ways of our fathers suggested in the paragraph above.

A VEGETABLE DOCTOR.

We have physicians for the human body. Veternarians for the animal class, and we are developing physicians for the vegetable kingdom as well.

In one of the January issues of the Literary Digest is an article, which describes the performance of Henry L. Bolley, a member of the faculty of the North Dakota Agricultural College, whose discoveries of remedies for diseases in plants have saved the farmers of America millions of dollars.

He not only diagnoses diseases of plants and vegetables, but be prescribes, as a doctor does, for their treatment and the generally accepted statement is that he is successful in his treatment.

He maintains a plant nursery or hospital, he studies the diseases of plants and cares for them just like a nurse cares for a sick patient. He has effected a cure, it is thought for flax-wilt, a serious disease in flax, by planting different species, in beds, side by side, and procuring the hardiest plants from which to save the seed expecting to secure a species that will, by and by, become free from wilt. This he expects to be able to do while he doctors the soil to free it from disease germs. In much the same way he studies wheat-smut, wheat-rust, and flax-rust as well as many other diseases of the vegetable world.

These experiments form but a small part of Professor Bolley's work, which embraces the investigation of all sorts of diseases of grain, fruit, etc., the study of weeds and their effect on soils. Bolley's discovery of the formaldehyde treatment of smut has saved farmers millions of dollars.

Much along the same line of work is that of J. W. Mills of the Riverside Experiment Station, of whom the country will hear more in the years to come.

News of Country Life in the Golden West

AGRICULTURE.

The following is the rainfall at Dinuba for the season 1906-7 to date, 7.14 inches.

The rainfall to date is 16.89 inches. Nine inches of snow have fallen since a week ago Sunday.—Chico News.

The rainfall at Hanford during the past week was 3.55 inches, making a total for the season here of over 8 inches.

The official rain figures for Soledad up to Tuesday, January 15th, are 8.20 inches; up to same date last year it was 3.24.

Eighty-seven million salmon eggs were taken this season in the three Government fisheries at Baird, Battle Creek and Mill Creek.

An almost continuous precipitation from Saturday to Wednesday raised the San Jacinto rain gauge from 9.06 inches to 10.30 inches.

Joe D. Bibble of Hanford, Tuesday shipped eight carloads of hogs to Los Angeles and San Francisco. The hogs were big fat porkers, averaging 265 pounds.

The price of eggs has been lowered and the Grass Valley Union, with eggstraordinary cackling, remarks that probably this is what the hens have been laying for.

The stock raisers on the foothill ranges about Marysville report that the long cold spell has had the effect of shrinking the cattle and horses running on pasture.

The total rainfall at the Power House of the Ontario Power Company in San Antonio Canyon is 20.37 inches for the season, and at Ninth street Ontario, it is 15.74 inches.

Total precipitation to last night, 14.75 inches, at San Barnardino. Total precipation at Squirrel Inn to yesterday morning at 7 o'clock 35.52 inches, or nearly three times that of last year to this date.

Total rainfall to date at Ukiah, is 15.45 inches. The maximum temperature January 6th, was 41 degrees. The minimum 23 degrees. The same day last year the maximum was 62 and the minimum 31 degrees.

The first biennial report of State Forester G. B. Lull, which has been submitted to the Government in a pamplet of forty pages, reviews the work of the State Board of Forestery since its creation in 1905.

The second annual convention of the Northern California Beekeepers' Association will be held in the Federated Trades Building, Room 1, 1017 J Street, Sacramento California, on the 28th and 29th of January, 1907.

The express shipments from Escondido for the week from the Well Fargo Express Company, were 86 cases or 2580 dozen of eggs, 1850 pounds of chickens, 1260 pounds of cream, 350 pounds of butter and 208 pounds of dressed veal.

The poultry show held at San Diego this year has been the most successful ever held in a financial way as well as other ways. Although not yet figured exactly it has been calculated that the show will have a net profit of $150.

There will be a meeting of the live stock raisers of Riverside county at Hemet, January 26, 1907, for the purpose of organizing a County Live Stock Association, and for the discussion of subjects that are of interest to the live stock industry.

Mr. O. H. Ellis, one of the prosperous and well known ranchers of Talbert, was in the city yesterday on business. Concerning the damage to the celery crop by the recent rains. Mr. Ellis said, that at present a rough estimate of from $75.000 to $100.00 has been placed on the celery loss.

A trainload of forty-six cars of fine celery left Orange county over the Southern Pacific last Saturday, and another of forty-seven cars started east on Monday, just two days later. This is the largest shipment ever made by this association and is probably the largest shipment of celery ever made in the world. Both of these trains are 25 per cent. larger than any shipment previously made.

The rainfall to Thursday morning, by the Southern Pacific gauge at Chico, was 16.07 inches for the season, as against 3.65 last season.

The total precipitation for the season at Highland is 15.06 inches, and at the rate the rain is falling at this writing the mark will reach 16 inches before the night is over.

To supply not only cantaloupes, but also tomatoes, cucumbers and watermelons to the eastern markets, will be the aim of the members of the Brawley Fruit Growers' Association.

The Thermal Cantaloupe Growers' Union has signed a contract with H. Woods for this year's crops, (shipments east of the Rockies) which carries an advance of 50 cents on all standards.

The train of forty-seven cars shipped from the peatlands Monday, contained 7755 crates, which contained 54,285 dozen or over 651,000 bunches of celery. This shipment will bring about $12.000 at the present prices.

The scarcity of hogs is becoming a matter of comment among those engaged in the shipping business in all parts of the State, but no doubt the good prices will stimulate the raising of many more, and cause many to enter the hog raising industry.

Stock hogs have become so scarce about Hanford that N. W. Mammond & Son, have decided to ship in a large number, which will be sold as feeders. They already have 450 east of town on the place owned by John Wetel, and in a few days will ship 1000 more.

El Dorado county has this week experienced the heavest snow-storm known here since the winter 1889-90. Since Saturday night snow has fallen to the following depths in various portions of the county: Placerville, 8 inches; Camino, 18 inches; Pleasant Valley and Grizzly Flat, 2 feet each; Pino Grande, 4 feet.

Thursday after the rain was over we took the measure in our teeth, donned a bathing suit and swam across the railroad track to the gauge and measured up 1.86 for the last shower. This makes a total of 2.96 for the rain of the past week, or 18.70 for the season against 4.84 for last season.—Santa Paula Chronicle.

Tehama county is opening up a new industry in the growing of tobacco. The experiment is to be started at once, and T. H. Ramsey, manager of the Cone ranch will plant an eighth of an acre of the tobacco seed, which will be furnished by J. B. Steward of the United States Department of Agriculture. The experiment will be tried by a number of others, who are anxious for the success of the new industry.

HORTICULTURE.

The season's rainfall in Jackson has been about four inches.

About four inches of snow fell in the vicinity of Vacaville last Sunday, being our first snow storm since the winter of 1902.

About two inches of snow fell in Cement on last Sunday and the hills and country surrounding were white. Since then some of the heaviest winter rains have fallen.

There was few shipments of oranges during last week, owing to the condition of the orchards from the severe rains. Fruit is growing large and inclined to puff and split open.

There was a heavy rainstorm at Salinas and Santa Cruz yesterday moring. The record for the season at the former city is 10.95 inches, while the latter place has had about 3 inches more.

The land office of the Southern Pacific railroad in San Francisco is swamped with applications from parties who are anzious to rent land for the sowing of wheat in the vicinity of Huron and Coalinga.

The storm for the past week amounting to 6.16 inches is somewhat settled bpt indications are for more rain. There was a slight frost for the past two mornings. The rainfal for the season to date amounts to 11.71 inches.—Diunba News.

Three carloads of apples were shipped from Watsonville Saturday night, making a total of 1790 carloads for the season to date.

The farmers north of the Tehachapi, have been greatly retarded in their work of plowing and seedling on account of the long wet spell. There has been but few clear days within the last month sitable for farming.

There was a precipation of .04 of an inch of rain Thursday night at Woodland, making a total of 15.32 inches for the season. The weather clerk is a little uncertain and says the weather will probably be cloudy Saturday.

Following is a tabulated statement of the fruit shipments from the state for the year 1906, in carloads: Cherries 150; Apricots 16; Peaches 584; Plums 1220; Pears 1513; Grapes 2050; Apples (to December 1st.) 669; Miscellaneous 22.

On New Year's day M. P. Kelly, killed the second large hog raised at his La Gloria ranch. It weighed 709 pounds and was three years old. The first one was a little larger, weighing 846 pounds, and was only two years and nine months old.—Gonzales Tribune.

At the annual meeting of the Davis Almond Growers' association at Davisville, the following officers were elected: President, G. K. Swingle; vice-president, G. W. Pierce; secretary and treasurer; J. W. Anderson; executive committee; O. B. Wilbur, Frank Palmer and Eli Snider.

The total shipment of citrus fruits by the Ontario-Cucamonga Fruit Exchange amounts to 172 cars, 95 cars being navel oranges and the balance Valencias and lemons. Considering the weather for the last week, this is indeed a good showing as many ranches are so wet that it is almost impossible to pick the fruit which is ready to be shipped.

E. E. Hendrick, a millionaire of Carbondale, Pennsylvania, has purchased 16,500 acres of land in the Moreno valley, including the Moreno and Alessandro town sites, paying therefor in the neighborhood of a half million of dollars. He will set the land out to oranges, and has planned already for the largest orange grove in America, one of ten thousand acres.

Last Tuesday two carloads of hogs were shipped from the Wheeler-Haldeman-Richard ranch, at Holtville to Los Angeles. They have been shipping right along an average of one or two carloads a month.

Up to 7 o'clock on the 17th, the rainfall at Salinas thus far this season is 12.74 inches, which is only 3 inches less than the total for the whole of last season

The California Citrus Union shipped from Fullerton six carloads of oranges during tthe past week, with a total of 32 for the season; Benchley Fruit Co. shipped three carloads the past week, with a total of 100; the Placentia Orange Growers' Association shipped three carloads the past week, with a total of 12; Thomas Strain, Jr., shipped three carloads the past week, with a total of 11.

The annual meeting of the stockholders of the Southern California Horticultural Society was held January 3 and the following directors were elected for the ensuing year: Walter Raymond, Fred H. Howard, J. G. Morley, Ernest Braunton, E. H. Rust, H. W. O'Melveny and Theodore Payne, and on the 19th the following officers were elected: President, Walter Raymond; V. Pres. J. G. Morley; Secretary, Ernest Braunton; Treasurer, J. Dieterich.

Today's rain record is .12 inch making the total for the season 10.13 inches. This exceeds the average for Riverside for the whole season, according to weather reports, for the past thirty years. Orange shipmentts have almost stopped. owing to the continued wetness, and very little fruit will be picked for shipment until drying weather comes. Fruit men who have studied the market conditions say that this enforced delay in orange shipments is the best thing that could happen to the growers, as prices are almost certain to advance.—Press.

LINERS

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the **Gold Medal** at the St. Louis World's Fair for greatest batch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be isued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. FILCHER, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.

HELPS AND HINDRANCES IN GETTING EGGS.

"I wish I had some eggs," said a neighbor just before Christmas "to take to a friend in the hospital." "Don't your hens lay?" "No, we have about seventy hens and are only getting one egg or half an egg a day, but we are better off than our neighbor, he has seven hundred hens and is only getting ten eggs a day."

"I will give you some eggs for your sick friend," said I. "How many are you getting and how many hens have you?" "I have fifteen pullets" was my reply and we are getting six or eight eggs a day, we had nine yesterday." "How do you do it?"

This little conversation keeps recurring to me. It is the "knowing how" and the "doing it" the same old story. We all want to get eggs both in season and out of season, and this month past my letter box has contained too many appeals for help "will you tell me why my hens don't lay?" Shall we today chat on helps and hindrances in getting eggs?

In most cases it is the poultry keepers own fault that their young pullets are not laying well, that they are in the backward condition in which they now find them. In many cases it has been caused by neglect and under feeding just at the time when the birds required the best of care and the most ample rations, but were prevented from receiving the same by the caretaker being occupied by something else, which at the time seem to need more attention, or because he (or she) was away behind in work and was oblodged to neglect something.

It sometimes happens, as the veteran poultryman and editor Mr. A. F. Hunter, has said, that to use an expression more plain than polite "they have bitten off more than they can chew." These good people who are now lacking in eggs, have tried to do more business than they could properly attend to, with the result that they neglected those important little details, which in the poultry business make all the difference between profit and loss.

Is not this very often true with the majority of us? Do we not often plan and lay out more than we can accomplish and then, when things crowd, we let something go and think it will be all right in the end? I think that most of the people who are now complaining that their pullets are not laying as they should, can if they would, look back and remember sometime when the pullets were stinted for a few days in food or were neglected in the matter of shade, or kept in an unsanitary condition, or in lousy henneries because their owners were too busy attending to something else, and they did not think a little neglect would matter much, or some may even have forgot that time now, but the pullets have not forgotten it and we are paying up now, reaping as we sowed in the summer time.

But confessing that some of us have been guilty of stunting the growth and maturity of the pullets at a time when we though we could not prevent it, what shall we do now?

Now we want eggs not only for the market and for our own table, but also for hatching. Early hatched pullets, if properly cared for, should all be laying and those that are not laying, those that for any reason are stunted, should be fattened and killed for the market. A pullet once stunted will never make an extra good layer.

The poultry keeper's advice is weed out the culls, don't give the benefit of the doubt to anything that looks as if it might pick up bye and bye and do something." Sell or eat the poor ones and keep the good ones or none at all. Twenty five good pullets will make more money and give the owner more solid satisfaction than two hundred of the stunted variety. "Dont bite off more than you can chew,' may be translated in the poultry yard to mean "don't keep anything that is not A. 1."

Sometimes it happens that when pullets are well grown, not stunted in anyway, they seem to hesitate about laying, and I have had people ask me if there is any danger of their overfeeding the pullets. There is no danger of too liberal a feeding of pullets; you may feed a wrongly balanced ration, but not a too liberal quantity. In fact it is necessary to feed with great liberality because at this time the pullet has three drains upon her vitality,—she is growing in size, she is adding to her winter coat of feathers, and she is forming the bunch of eggs in the ovaries. A pullet needs an ample supply of food for all this, and if underfed at this time something will have to wait, and that something will be the eggs or if not the eggs it will be the size, and that will mean in the end a poor layer, for undersized hens are poor layers.

If your pullets are well grown and healthy and yet are not laying, give them a little more animal food. They require a stimulus, a slight shock of some kind to start the eggs to moving. Some extra meat will usually do it, or try "grandmother's" plan and give one teaspoonful of red pepper three times a week, for a dozen fowls in the mash, and give all the milk you can spare. Mr. Fox says, "given milk and red pepper any hen will lay in winter." Red pepper is the stimulant in all the "condition powders" or "egg foods." It is a stimulant and can be used successfully to start the pullets laying, but should only be continued for a short time, and should not be used for breeding hens, as it will induce infertility .

For breeding stock it is considered best to keep hens that are over a year old as chickens from them are found to be more vigorous than from younger birds. However a well grown, vigorous pullet that lays good sized eggs, eggs as large as an older hen, will have, if properly fed, vigorous chicks.

The feeding for fertility must always be kept in mind. In this we must consult nature, and she tells us that in the spring time, when fertility is the important thing, she feeds more annual food and more green food than at any other time. If you imitate nature you will have healthy thrifty hens and strong fertility in the eggs.

ALAMEDA POULTRY SHOW.

The Third Annual Exhibition of the Alameda County Poultry Association, held at Idora Park, Oakland, from January 7—13, met with a good attendance and the exhibitors were well pleased. The total number of birds shown being between 700 and 800, many of them in the best possible condition scoring close to the 100 mark. The judges were R. J. Venn, Fresno, C. G. Hines, Alameda, Vincent Huntly, Petaluma, and David Larson, Turlock.

Among the prominent breeders of Northern California, carring away the ribbons, cash prizes, and silver trophies were:

Mrs. Florence E. Bemis, of Oakland, winning 25 ribbons and 3 silver cups, with her famous strain of White and Barred Plymouth Rocks. Mrs F. M. Newbert, of Sacramento, showed white Leghorns and Light Brahmas, having the highest scored birds in the show. S. C. White, Leghorn pullets, scoring 96 points, winning the Ivory Soap Silver Cup.

Miss C. B. Carrington, of Haywards, with S. C. White Leghorns, carried away many of the prizes.

G. H. Popperwell, of Stockton, showed Barred Plymouth Rocks White Leghorns, and Black Minorcas, winning ten ribbons.

Serutton and Huntly of Petaluma, with a special showing of Aylesbury Ducks. These ducks attracted much attention among the duck fanciers, owing to their size, weighing from 10 to 12 pounds, winning the Silver Cup for ducks. Among them were some of the direct importation, having been brought to this country a short time ago by Mr. Serutton, at a great cost.

The Coulson Poultry and Stock Food company, had a fine showing of White Minorcas, winning 8 ribbons, a good showing for their first exhibition of these birds. They also had a fine exhibit of their foods, which attracted much attention as they made

A NOTED SALE OF WHITE P. ROCKS.

Not for years has there been so much talk among poultry men in this part of the State as when the announcement was made that Mr. A. J. Little had bought from Mr. Humphrey's, his entire flock of White Plymouth Rocks. It is a well known fact that Mr. Humphrey's yards contained the best White Plymouth Rocks in the State, that he was not only a fancier, but a breeder. When we look at his birds now and see the improvement he has made in a few years, we want to give him the name of "Wm. Conqueror." Mr. Humphry is a man who enjoys meeting obstacles, and overcoming them. He not only met and defeatd his rivals in the show, but worked to overcome the faults of the breed, to which he gave so much time and study.

Mr. Little is also a fancier, and has a love for his birds, and we believe if any one thing, more than any other, figured in the sale as a consideration, is the fact that he is capable of taking up the work where Mr. Humphrey left it, and carying it on, perfecting the breed and bringing it to a still higher standard.

Mr. Little has plenty room for a large poultry ranch, and we believe by devoting his undivided attention to one variety, he can do for California what U. R. Fishel has done for Indiana.

Some six or eight weeks ago, Mr. Humphry met with a severe accident in a runaway, and since that time has been unable to care for his birds. This we understand is his reason for selling out. He says that he is not out of the fancy for good, but that he still wishes to be identified with the industry.

Good as has been the season of 1906 for sugar making at Chino, the coming year promises still better, for a larger area than ever is contracted for. Every-thing is in fine condition and a bigger crop is expected than last year. The increase in production here is expected to be not less than a ton an acre.

HONOLULU POULTRY SHOW.

During the third week in December, Honolulu held a poultry show, which created a great deal of interest in and about the city and proved in every way satisfactory to those in charge

The exhibit comprised the following numbers and varieties; the number representing the number of coops:

Fifty-seven barred Plymouth Rocks, thirteen white ditto, one silver laced Wyandotte, five white ditto, three buff ditto, four Columbian ditto, three Rhode Island reds, six light Brahmas, one cock weighing 13 1-4 pounds, the standard weight being twelve pounds, one dark Brahma, seven buff Cochins, two Cochin Partridge, two black Langshan, five brown leghorn, nineteen white ditto, three buff ditto, nine black Minorca, four ditto, one blue Andalusian, five silver laced Dorkings, four buff Orpingtons, four black ditto, two black game, two Cornish Indian, two Pit Game, two Japanese Game, one American Game, one Toulouse geese, one white turkey, two bronze ditto, three Pekin ducks, one Muscovy duck, one bantam and many of pigeons.

The man who wants to drown his trouble never takes it to a millpond.

6 Firsts and 2 Second Prizes and 2 Specials at San Jose with 10 Entries is Our First Achievement This Season

GETTING WINTER EGGS

The greatest profit from hens is in making yours lay when the other fellow's don't—an easy thing to do when each morning's feed contains a small portion of Dr. Hess Poultry Pan-a-ce-a. This tonic preparation also cures gapes, cholera, roup, indigestion, etc.

DR. HESS
Poultry PAN-A-CE-A

is a wonderful assistant to hen nature. By its use, functions and organs, which in confinement become dormant or inactive, are **compelled** in an easy and natural manner to act as nature intended. This is why Dr. Hess Poultry Pan-a-ce-a fills the egg basket in winter. It is the prescription of Dr. Hess (M. D., D.V. S.), and is endorsed by leading poultry associations in United States and Canada. **It costs but a penny a day for 30 fowls, and is sold on a written guarantee.**

1½ lb. package, 35c. 12 lbs. $1.75
5 lbs. 85c. 25-lb. pail, $3.50

Send 2 cents for Dr. Hess 48-page Poultry Book, free.

The Ornamental Garden

By ERNEST BRAUNTON

Common Names

MUCH AS may be said in favor of having common names for plants, it cannot be disputed hat to be intelligible the world over, he scientific appellation is the only e to be recognized when buying or lling. To latinize the names of varies appears uncalled for often, and t in the commerce of the world it sists trade to have even these. Plant collectors unacquainted with e botanical names of plants are a ague to the nurseryman. Take the se of cedar for instance; depending which part of the country the colctor is in, all the folowing trees e called cedar—Chamaecyparis ujoides, Libocedrus decurrens, Thuja cidentalis, Cupressus Lawsoniana d all the many juniperus, while red dar is Puniperus virginiana. From llectors unacquainted with scientific mes it is impossible to know what ill be received under a common me, unless one is well acquainted ith the trees that grow with them. ere is nothing better to do than for talogue makers to stand by scientific mes. When these are rightly adopt I there is no fear of being misunrstood, both buyer and seller know hat they are doing, and trade is ade easier for all concerned.

GRASS.

Gather a single blade of grass, and camine for a minute, quietly, its narow, sword-shaped strip of fluted reen. Nothing, as it seems, there notable goodness or beauty. A very ttle tallness, and a very little rength, and a few delicate, long nes meeting in a point—not a perct point, either, but blunt and unished—by no means a creditable or pparently much-cared-for example of ature's workmanship; made only to trodden on today, and tomorrow to cast into the oven; and a little, ale and hollow stalk, feeble and flacd, leading down to the dull brown bers of roots. And yet, think of it ell and judge whether, of all the orgeous flowers that beam in summer ir, and of all strong and goodly trees stately palm and pine, strong ash nd oak, scented citron and burdend vine—there be any by man so eeply loved, by God so highly graced, s that narrow point of feeble green. nd well does it fill its mission; conider what we owe merely to the meaow grass, to the covering of the dark round by that glorious enamel, by he companies of those soft and countess and peaceful spears.. * * * ll spring and summer is in them—he walks by silent scented paths—he rests in noonday heats—the joy f herds and flocks—the power of all hepherd life and meditation—the life f sunlight upon the world, falling in merald streaks, and falling in soft lue shadows, where else it would ave struck upon the dark mold or corching dust.—John Ruskin.

NATIVE ORNAMENTAL PLANTS

It is not necessary to repeat here he instructions for transplanting dorant plants. Most people who have eached maturity have had some exerience, and those who have not may nd instructions in nearly any book n agriculture or horticulture, or even n some nurserymen's catalogues. To void difficulties, it is recommended hat the would-be gardener notice arefully the native plants of his reion during the growing season, makng particular note of the horticultural ossibilities and habits of each, and t the same time examining each with sufficient care to be able to recognize t without leaves or flowers or fruit. When next they are dormant such plants as are selected may be transplanted. Such treatment is, of course, not necessary with any kind of evergreens.

It must be remembered that the roots of conifers should never be allowed to dry during the operation of transplanting. A good way to avoid drying is to "puddle" them at once, as nurserymen do, by dipping the roots in a thin mud or a mixture containing fresh cow manure and then wrapping them in wet straw or trash which will keep them moist.

Plants which grow in shallow rocky soil are rather difficult to dig because, in such soil, the roots spread widely, and in digging it is hard to avoid cutting off the smaller rootlets with the pick or spade. The moral to this is to get all the roots of the plant that you can.

Plants just transplanted must be watered immediately and the soil compacted sufficiently to bring the wet soil into close contact with the roots. Nor must the soil be allowed to cake and sun-crack later on, else the moisture will evaporate and the plants die. Practically nothing but cacti will bear transplanting into a dry soil without being irrigated at the time of transplanting, and we would irrigate cacti even if it were necessary to carry the water in a bucket.

THE BAMBOOS.

The genuine Bamboo should be grown by every farmer. The time will come when these giant reeds will be found as useful here as in other countries, where they are considered necessities; they grow to perfection in well-drained, deep, rich soil, and are very ornamental.

Valet—Do you think master's illness will prove fatal? 'E throws everything in the place at me, sir.

Doctor—No, Jorkins. Those are not death throes.

PLANT THESE FOR GORGEOUS GARDENS

A Splendid New Collection of Flower Seeds, to Win New Laurels for The Chas. H. Lilly Co.

These varieties are widely different and include bed, vine and aquatic plants. Each is much improved over anything of the same species heretofore produced, and will excel in color effects and profusion anything you have ever before known in these varieties. Read descriptions carefully, and note our attractive Special Offer.

LILLY'S BEST SEEDS. BEST FOR THE WEST — LILLY'S BEST — SUPERIORITY THE REASON OF LILLY SUCCESS

Grown in Western soil and the recognized standard for all Pacific Coast States. Cost no more than seeds of unknown quality or unadapted Eastern origin.

LILLY'S GORGEOUS SINGLE DAHLIAS

Growing 4 feet tall or more, these Dahlias present a riot of rich, luxuriant color. The best sorts selected from the newest varieties; such valuable novelties as "Twentieth Century," "American Flag," "Lucifer," and other late introductions. The large blossoms are in many gorgeous shades—yellow mottled, black, scarlet with black hearts and stems, pure white, bright crimson, spotted—every imaginable combination of splendid coloring in brilliant contrasts. Blooming begins in June and keeps a continuous outburst of beauty until frost. Bulbs may be left in ground, where they remain ☐ ready for sprouting in the spring, without work or thought until time for the regular spring weeding and trimming. The blossoms make luxurious bouquets when cut with long stems and artistically arranged. Per packet 10c

COLUMBIA GALLARDIA

This plant blooms perennially, and first year of seeding offers a wealth of gorgeous yellow blossoms with dark maroon spots and discs. When grown in large groups in beds is strikingly effective in brilliancy. For decorative purposes most handsome. Its immense and brilliant flowers on long self-supporting stems "vase" handsomely, and remain perfect for a week after cutting. Blossoms are single and measure from 2 to 3 inches across. The plant blooms all summer and is hardy anywhere, being in ☐ nature a desert flower. Blossoms early in spring, and blooms continuously until frost comes. After first year the plants come on from the nature seeding of year before. Mixed colors, per pkt. 10c

LILLY GIANT EVER-BLOOMING LARKSPUR

Beautiful long spikes of large blue flowers; great quantities the first season from seed. Individual flowers light blue with white centers, dark blue with white centers, and light or dark blue with dark or light blue centers. Individual plants sturdy and very productive of new shoots; blooms all summer if old sprouts are cut off. They crave ☐ rich soil, and respond with ready growth. Very effective with other tall plants, or behind borders of lower plants. Grows 4 to 6 feet first year, 7 to 8 feet tall second year. All shades in the several combinations. Per packet 10c

SWEET-SCENTED SNAP DRAGON

Form brilliant garden beds, flowering prodigiously and continuously first season from seeds. These plants grow about 2 feet high, are healthy and stocky and completely enveloped with large snap-dragon flowers of splendid texture and substance; are very durable under all conditions of weather. Their continuous-blooming qualities, ease of culture, independence of heat and drought; and pure, bright colors, entitle them to a permanent place in all gardens. Although perennials, they do splendidly when grown as annuals; spring-sown seed produces flow- ☐ ering plants by July, which bloom in increasing profusion until frost. These flowers are nearly double the size of older sorts, and have a most delightful odor, while the old varieties are devoid of fragrance. Per packet 10c

EGYPTIAN LOTUS

The far-famed Egyptian Lotus is the easiest of all water lilies to grow; produces superb flowers and magnificent foliage in splendid tropical effect. The flowers are about a foot across when fully opened, of a deep rose or creamy white, and exquisitely fragrant. Sow in any good garden soil, finely sifted. The seed will usually lie dormant for a month or more. After sowing, pots should be submerged in water, which should be kept at about ☐ 70 degrees. Two inches of water over pots is sufficient. As soon as the seedlings make 2 or 3 leaves they should be transplanted. Wherever there is a pond, lake or other water, the Egyptian Lotus should be grown. Per packet 25c

IMPERIAL JAPANESE GIANT MORNING GLORIES

The vines present a beautiful wall of luxuriant foliage thick with flowers of gigantic dimensions. These flowers, measuring four to six inches across, are of limitless new and exquisite colors, while the shadings and markings produce a mass of such incomparable beauty that descriptions are ☐ inadequate. The blooms appear both double and single, the double producing dainty effects in myriad color variations. The plant is of strong and robust growth, vines quickly reaching a height of 30 to 40 feet. Per packet 10c

SPECIAL OFFER

$1.50 of above Seeds for $1.00. Six 10c packets for 50c (including one packet of Old Fashioned Flower Garden Seeds free). Three 10c packets for 25c. All postage paid.

LILLY'S NEW 1907 SEED CATALOGUE

Surpasses all previous books in attractiveness and completeness of plant information; contains descriptions, price lists and culture directions for thousands of varieties of seeds, bulbs, roots and cuttings. Also is a hand- ☐ book of information on poultry foods and supplies, stock foods, fertilizers, garden supplies, sprays, horticultural supplies, etc. If you want one free, mark an X in the white square.

HOW TO ORDER

This offer of Lilly's Best Flower Seeds is intended solely for introductory purposes, and is available only through this advertisement. Mark an X in each white square opposite the variety of seed you wish to order, mark the quantity in square or on margin, figure up the total, clip out the ad., and remit in same envelope with the clipped ad. Be sure and write your name and address plainly, filling in the following blank:

California Horticultural

By JOHN ISAAC, Sacramento, California

The Eucalypti

THE EUCALYPTUS is coming in- rapidly at that, if we can judge to public favor again, and very from the great number of inquiries made concerning it. When this tree was introduced to our State some years ago, it was somewhat of a curiosity and attracted much attention at that time for this reason, but the interest died out largely, and this valuable tree received little attention until within the past year or two. The reason for this revival of interest is plain. We have industriously destroyed our forests, until the government has been compelled to step in and endeavor to save the remnants. As a result, we are brought face to face with a possible timber famine, and we may add to this a fuel shortage, for a very large part of our people depend upon wood for fuel, and those who do not are dependent upon railroads to bring them coal, and the experience of the present season has shown that this is not always a reliable dependence. So, facing a timber and fuel shortage, our people have naturally turned to a new source of both, and this is furnished in the eucalyptus. This tree is one of the most rapid of growers; it can be topped frequently, its wood is hard and makes excellent fuel, while it is equally useful in the arts, many of the species furnishing excellent wagon timber and woods for furniture and for finishing building. There is no doubt, but that the newly awakened interest in the eucalyptus will be a permanent one, and that this tree will be grown all over our States and will very largely replace our destroyed forests.

CONQUERING THE PEAR BLIGHT.

Pear blight is still the principal subject of importance in the Northern California fruit sections. The great bulk of the pear crop has been grown in this part of the state and it has been, in the past, one of the chief and most profitable of our fruit crops. Of, course when an industry like this is threatened with destruction it awakens interest among all classes. Prof. Waite, while here, started the winter campaign against this disease and since his departure, the work has been going steadily on under direction of Prof. Scott, his assistant. Reports from all the pear sections where the campaign was carried on last winter, indicate that very effective work was done and that it has been fully demonstrated that, with careful cutting and close watching, the pear industry will be saved to our state. The orchardists themselves have fully awakened to the necessity of the work and also to the efficacy of it when properly done, and all through the pear section this winter thorough work is being done. California is now practically the last place in which the Bartlett pear is grown and it commands such good prices that every endeavor is being made to save it from ultimate destruction.

ESTABLISHING THE PARASITES.

Mr. Compere on his return from the Orient recently, brought with him a number of trees and plants infested with red and purple scale, which contained parasites. These parasites were so exceedingly small as to be invisible to the naked eye, and it was found impracticable to capture and ship them safely to distant points. For this reason the trees themselves were transported to Southern California and established in the midst of a scale infested section, in the hopes that the beneficial insects as they escaped from their original host insects might find a lodgment in the infested orchards, to which they were transported. If the experiment should prove successful, trees and branches will be taken from the orchards in which they have been established and transferred to other sections, until it is hoped, they will become generally established over the whole of the infested area.

A measurement at El Modena shows 14.36 of rain for the season.

PEACH BLIGHT.

There is a great deal of uneas at present over the spread of the p blight, and many orchardists think it is a new disease in our state, wh as it has probably prevailed, to a gr er or less extent, ever since pea have been grown. Certain it is, it has been a common disease f quarter of a century, varying in in sity with different seasons, and p ably largely influenced by clim conditions, appearing in such sea when conditions were favorable to growth with destructive force causing peach growers to fear their trees. Here is a statement cerning this disease made by Mr. Loomis, President of the Santa C Mountain Fruit Grower's Associa in the spring of 1883 and made a of the first report of the Inspecto fruit pests to the State Board Horticulture:

"In some localities here, peach t especially are badly affected with w they call "gum blight," and in s instances the trees are dead or ne so. It commenced with the yo wood and that which was the least tured, and gradually transmitted the whole tree. The branches covered with particles of gum."

When we consider that we had peach blight so bad before, and t it has been reduced below the dan line by natural causes, we may h that it will again become reduced it does not wholly disappear; at same time it will be well to take precautionary measures against it.

ABOUT VINEYARD STAKES.

This is the time of year when yo vineyards should be staked. Some v ities of grapes may be allowed to to the second year, before tying up, we always have a better vine if train them straight up from the ginning. Stakes are so scarce and high this year, that many will h to do without them or devise so substitute. To such we would reco men the following. If such material willow, popular, or other wood can obtained green, it can be split i stakes, and the smaller branches a used, these last must be first sharpen at the ground end and immediat after cutting and while still green, th should all be dipped for 24 hours in solution of bluestone 4 to 6 per cen this would be about 4 to 6 pounds bluestone to 12½ gallons of wat Stakes after being cut, must be di ped at once and not allowed to d out. If one has seasoned wood similar material, the ends may sharpened and charred in a fire, better dipped in a solution of miner paint, made with cast iron, cement a skimmed milk.

The best stake of all and one th should displace all wooden stakes a cement stake made as follows. wooden mould is made to take 6 12 stakes at each moulding, one-ha inch space between each stake, a moulded, is sufficient. The ends shou be pointed on two sides only. One two pieces of heavy close barbe wire, should be incorporated in th cement of each stake as it is place in the moulds. One part of goo cement to three parts clean, coarse sand is sufficient. Mix th cement fairly stiff, so as not to be so or watery. These stakes—well made will last a lifetime. They can be car fully driven, with a metal thimb to fit over the top, but if a good har wood maul is used, this is not neces sary. The moulds referred to are 2 for each stake.

Even if the stake should be broke or fissured, the wire will hold it i place—provided it is not shattered and it will serve its purpose almost a well as a sound stake. Anyone ac quainted with cement work. Can mak such stakes, and with a reasonabl price for cement and barbed wire, the are cheaper and better than the wood en stake and are practically ever lasting.— Dr. W. N. Sherman.

The rainfall for the season to dat is 14.97, against 3.15 for the same dat last year.—San Fernando Press.

rly Willard Potatoes.

We have enquiries about the Early illard potato and know nothing out it. Who can enlighten us?

ind Break.

Will you kindly advise me through e columns of the Cultivator what in ur judgement is the best means of otecting an orchard from high nds.—J. G., Seattle.

For best trees for wind-break we uld advise you to apply to your ate Agricultural Experiment Sta- on, stating where orchard is located. ey are in a position to advise you re intelligently than anyone else.

il Erosion.

The heavy rains and consequent ero- n of upland soils call attention to e need of some means of preventing rther damage from washing deep llies through the land.

Courses have to be provided for e escape of storm water, but these pidly cut down to great depths and m the falling in of their banks be- me enormous barrancas.

Is there any plant or grass that uld be planted on the bottom and des of these barrancas that would revent further erosion? How would ppia ripens do?—H. F. C., Ventura.

Prof. Forbes of the Arizona Ex- riment Station states in a bulletin at Lippia has been used for this rpose with the very best of success. ir observation on this point has l to the same conclusion, and we do t hesitate to recommend it.

llination.

Please state in your next issue, hich of the following kinds of pears id apricots will pollinate best.

Pears:—Bartlett, Le Conte, Beure lairgean, Patrick Barry, Winter elis, Beure Diel, Clapps Favorite. adeline, Flemish Beauty, Anjou, eckel, Beurre Rose, Josephine, No- eau, Poteau.

Apricots:—Newcastle, Royal, Moor- ark, Blenheim, Montgamet.—"Calexi- ."

Judging from bearing qualities, Le onte, Patrick Barry, Clapp's and adeline pollinate best. With apri- ots, Royal, Blenheim and Newcastle. f course, there is always a vari- tion with some seasons and istricts. Our opinion is drawn from xperiments made at the Experiment tation on the Chino Ranch. In the ry warm climate of your valley, there eems to be a more perfect setting of uit with some varieties, than there in the coast valleys.—J. W. M.

nsatisfactory Oranges.

There is one quality in my oranges hat I do not like, at all, the tissue hat encloses each section is very ough (on some trees only.)

They have not been frozen so I now it is not that, in every other espect the fruit is perfect, fine color, hin, fine skin. fine grained juice cells, verything good, but that toughness f tissue: what is the cause and reme- y; also every winter the leaves are o easily blown off.

We live up near the Arrowhead, and ave a great deal of north wind of ourse, but the north sides of the trees re nearly bare. We use, irrigating vater that has some of the water from he hot mineral springs in it; we con- ider that the cause, is it?. What an we do to remedy it?—H. A. H., San Bernardino.

If some of your trees produce fruit with tough fiber as you describe, while other trees in the orchard do not, it is evidently due to the char- acter of the trees and not the treat- ment. This is a case where proper se- lection of buds was neglected and some of your trees were grown from buds taken from trees that produced just that kind of fruit. Again, it may be possible that the buds which produced those particular trees came from a branch that was a sport, that is one which varied just that much from the regular type. This could not have been determined until that branch bore fruit. It is quite common for a tree to produce several types of or- anges at the same time and on the same side of the tree.

No doubt the mineral water has a bad effect on your trees, judging from your description. If you have no pure water to irrigate with, the best thing you can do is to use large quantities of it and keep the water moving down through the soil. This prevents an ac- cumulation of salts in the soil, great- er than the amount already in the water. This same problem came up at Corona with the Lake Elsinore water and the same advice was given to the growers by Prof. Hilgard and those who followed his advice came out with their orchards in good shape, while those who did not, lost heavily. The point is, that just before an ir- rigation,: there is a much greater percentage of water in the soil near the surface than there is immediately after, the water applied washing it down into the lower layers of soil. If but a light irrigation is given, this collection of salts from previous irri- gations is not far enough down to pre- vent its coming up again when the surface dries. Thus the amount in- creases continually. If an excess of water is applied, the excess of salts is sent down and off through the drainage. Of course this cannot be done unless there is good subdrainage. A clay subsoil would prevent such drainage.—J. W. M.

Water Glass.

Wil you please publish Mrs. A. Basley's receipt in full for preserving eggs in water glass, also the kind of vessel used? Your respt. E. A. P., Cordelia.

To keep eggs two things are neces- sary,—to exclude all germs of life from within and to exclude all germs of life from without. To exclude germs from without eggs must in some way be protected from the air. The two sure methods of keeping eggs a year are to preserve them, either in lime water pickle or in water-glass some- times called liquid-glass, or soluble glass, "silicate of soda" is the drug- gists' name for it. It is a liquid of a rather smooth, slippery consistency, something like glucose in appearence, readily soluble in water. The price at the large drug stores in Los Angeles and in San Francisco, is from sixty five cents to a dollar a gallon a ccord- ing to the amount taken, so it is cheap- er to join some of the neighbors and take from five to ten gallons. One gallon will be enough to preserve about sixty dozen eggs.

The directions for use are: Use pure water that has been thoroughly boil- ed and cooled. To each ten quarts of this water add one quart of water- glass. Pack the eggs in a jar and pour the solution over them. Or the solu- tion may be prepared, placed in the jar, and fresh eggs added from time to time until the jar is full, but be careful to keep fully two inches of the solution to cover the eggs. Keep the eggs in a cool place and covered to prevent evaporation. A cool cellar is a good place to keep the jar of eggs. Stone jars are the best recep- acles for the eggs, but they can be kept in thoroughly clean kegs or bar- rels. I have kept them in five gallon oil cans, but found the soda rusted the cans and the rust discolored the eggs. I have kept eggs every year for the last four years.—Mrs. A. B.

Cement Test.

A subscriber at Lemon Cove, wishes of cement made to determine value of a deposit on his lands. Who can tell him?

Our best dairy authorities tell us to never take a calf away from the cow until it has had the first milk. It the cow is healthy, this milk contians es- sentials to the calf's digestion.

Household Department

SOMETIME.

Last night, my darling, as you slept
I thought I heard you sigh,
And to your little crib I crept
And watched a space thereby.
And then I stooped and kissed your brow,
For oh, I love you so!
You are too young to know it now.

But some time you shall know.
Some time, when in a darkened place,
Where others come to weep,
Your eyes shall look upon a face
Calm in eternal sleep;
The speechless lips, the wrinkled brow,
The patient smile shall show—
You are to young to know it now,
But some time you shall know.

Look backward then into the years
And see me here tonight:
See, oh, my darling, how my tears
Are falling as I write
And feel once more upon your brow
The kiss of long ago—
You are to young to know it now,
But some time you shall know.
—Eugene Field.

The Teacher and the Rustlers

He was very much pleased at the settlement when a rattle-trap rigg drove up with a man and a girl. The man said he was lookin' for a convenient place for his daughter to open a school and wished to know if Scratch-gravel wanted one. He added able to give. We wanted a school mighty bad, not that the children needed l'arnin', for there wasn't no use for it at Scratchgravel, but their mothers liked to talk across lots with one another, and the children bothered 'em while they was doin' it. So the schoolmarm was engaged, her father drove away, and the children was kept cooped up for five hours a day while their mothers was a-gossipin'.

It was about this time that the hoss stealin' commenced. Not that we hadn't had hoss stealin'. We had. But somehow the rascals had found a way o'gittin' inside our corrals and stampedin' the stock. We organized a watch, but as soon as we did the hoss stealin' stopped. We dropped the watch, and it begun again. Then, the watch bein' too hard on the men o' the settlement, we took in the wimmen. Nobody saw nothin' till it come the teacher's turn, when the hull gang o' hoss thieves come down on us to oncet, and she lit after 'em ,firin' at 'em, and saved a dozen hosses they had loosed ready to run off.

This made the school teacher mighty popular, and, since she was a good looking gal with pink cheeks, several o' the bachelors o' the settlement wanted to marry her. But she wouldn't have none of 'em, sayin' her heart was with the dear little innocents she was teachin'. Another thing that lifted the schoolmarm in our affections was that she put us on to somep'n that we didn't think of before. She said that some one was loosenin' the hosses and the thieves would swoop down and drive' em off. This some one must be one of us. We all looked at each other suspicious-like, every feller wonderin' if he wasn't suspicioned. It wouldn't do to put any of us on watch for fear o' puttin' on the man that was doin' the business. At last two or three of us got together and after talkin' the matter over allowed we'd ask the teacher to do a little detective work to find out who the traitor was. This was natcheral, seein' she'd got on to the fact that there was a traitor. She said she'd keep her eye skinned for him, but unless she could ketch him in the act we wouldn't believe in his guilt. We swore we would and waited for her to work up the case.

While this was a-goin' on the rustlers had got away with most o' the hosses. Fact is there wastn't but half a dozen on 'em left in the hull settlement. One stormy night we heered a clatterin' o' hoofs and went out to try and save the stock. The hoss thieves had started the bull lot of 'em, but two had got away and turned back. Ben Hath-away and me got saddles on to 'em and lit out to try and save the other four. We chased 'em purty lively and was a-ketchin' up with 'em when the hoss one of 'em was ridin' struck a deep mudhole and fell. We was goin' right on, but he stood in the middle o' the road pumpin' lead at us, and we drew up. It was so dark we couldn't see him, and he couldn't see us; there fore he couldn't hit us nor we him. Suddenly there was a big flash o' lightnin', and there in the middle o' the road stood a women. But, though the flash was only instantan'ous, both of us saw for the millionth part of a second, plain as at noonday, the schoolmarm.

Before we had a chance to say anything to each other there come another flash, and three shots rung out after it and before the thunder. One 'o 'em was from the school teacher,and t'other two was from me and Ben. We heered a yell, and I, dismoutned', give my hoss to Ben and walked to the mudhole. I held my shootin' iron cocked before me, for there was plenty of lightin', and I didn't want to git plunked while lighted up by a flash. But the first bright one that come showed the woman layin' in a heap across the mudhole.

My conscience troubled me for shootin' a women ,even if she was in league with hoss thieves, and I went on, callin' to Ben at the same time to come on, too, hopin' the gal might not be dead and we could save her life. When we got to where she was she groaned, and we knowed she was alive. We couldn't do nothin' for her out there in the dark, so we put her on one o' the horses, holdin' her on, and walked back to the settlement. When we got there everybody was outside, some o' 'em with lanterns. What do you suppose that gal had the gall to do? She pointed to Ben and me and gasped:

"These two done it. They loosened the stock for the rustlers."

Well, there we was convicted o' hoss stealin' and had shot the gal that had been watchin' us.

The next mornin' airly we was both taken under a big tree and a noose throwed around our necks. They was just about to swing us off when a sheriff come dashin' into town lookin' for Kid Regan, the boy boss thief. As soon as he hearn o' the school teacher he asked to see her, and the minute he sot eyes on to her recognized her for Regan. But the kid defeated justice by dyin' the same day. That's how Ben and me was saved from a hoss stealin' death.—Amy B. Kennedy.

GOOD DRIVER IN BAD PLACE

We had ordered some coal from J. T., deal. I sat by the window when the first load arrived, and as the team came up the soft, muddy avenue toward the house I feared to see whipping and to hear swearing, and was on the point of retreating to the back part of the house to avoid the expected shock, when the driver began coaxing and patting the horses in the kindest manner.

The poor beasts in return strained every muscle in their efforts to bring the load up the ascent. The driver encouraged and coaxed, and all three seemed to work with mutual endeavor and good will. But all to no purpose. The wheels sank into the soft mud, and it was evident the thing could not be done; so he dumped the coal right down in front of the house.

I could not help going out and telling him how much it gratified me to see a man who had feeling for his horses. "Well," said he, "I don't see any use in beating animals when they are doing the best they can for us."

The same man came again and was equally kind and considerate, though he succeeded in getting his load to its destination. I have seen him bring coal to a neighbor since the last snow came, and he took his shovel along to ease the bad places.

May this good driver, in his turn, be kindly dealt with; and in his journey through life find some friendly hand to ease him in the bad places.—S. B. S.

If there is a man on earth who can invent a uniform and correct system of punctuation a fortune awaits him.

SHIPWRECKED LIFE.

There is a story current in Atchison, Kans., the home of the former Senator, Ralph Burton, to the effect that when he was fifteen years old a friend said to his widowed mother:

"How bright your boy Ralph is." And the wise women replied: "Yes, but it is the bright doys who make their mothers' hearts ache."

Ralph Burton had the best chance of any young man in Kansas. In the first place Nature had endowed him with a brilliant mind. He was a "bright boy from infancy to manhood." He was capable of winning prizes at school. He was impressively clever all through his youth; and Kansas people made it a point to help him.

It was the old story of the man with the talents. He who had much, received more. He who had little was likely to lose the little he had.

In politics Burton was as successful as he had been at school. Always a leader of the men, he had the knack of making them love his leadership. But down under it all the man lacked character. His smartness was not founded on the rock of genuine goodness. His house of hope was built upon the sand .And when the storm of temptation came that house went down. And great was the fall thereof.

It is a sad thing to send a senator of the United States to the penitentiary, but it would be a vastly sadder thing if a senator of the United States could violate law without having to pay the penalty which is laid upon other men. It is a disaster to interrupt a career so brilliant as that of Ralph Burton. But it would be vastly more disastrous if the country could not punish him, his offense having being proved.

The good that comes from the case lies in the fact that other men in and out of the senate will learn to respect law. They will get out of the notion that they are superior to it. They will be honest because it is dangerous to be anything else—even if they have no better reason.

But shipwrecked men are not necessarily lost.

As for him he is a young man, and this sentence to the penitentiary will be his ruin or his redemption, depending on whether he has any thing in him. If he has, he will come out and make his way in the world in spite of the load. If he has not, he will come out—and get in again.

And for the present that is all of Burton.—Salt Lake Inter-Mountain.

THE LIFE-SAVING SERVICE.

Last week was a busy and anxious time for the life-saving service on the New Jersey coast, and it is impossible at this writing to say how many lives have been rescued by these daring life-savers. It is a crying shame that no provision is made for these noble fellows who risk their lives for their fellow-man, and who, in event of an injury or sickness received in the performance of their duty, are left to care for themselves. If ever men deserved a place on the pension rolls it is these brave, daring men who patrol the beaches by day and night to warn vessels of their impending danger or to rescue their imperilled brothers of the sea from death.

We shall never rest content until the people rise up and demand of Congress a proper law that shall give the men of the life-saving service what is their just dues, so that when stricken down in their line of duty, and they are no longer fitted for active life, that ample provision shall be made to insure them some of the comforts of life in their days of need, and so that they shall not say that "Republics are ungrateful."—American Shipbuilder.

A DOUBLE DOSE.

A close-fisted old farmer thought there was a good chance to get some legal advice from the young man, gratis, so he dropped into his office, told him how glad he was that he had come into town, because the old judge was getting superannuated, and contrived in the course of the talk to get the legal information he wanted, and then bidding him good morning was about to leave when the young man asked for his fee. "What for?" said the old farmer. "For legal advice," replied the young lawyer." The farmer declared he would never pay it, and the young lawyer told him if he didn't he would sue him. So the farmer trotted down to see the old judge, whom he found hoeing in his garden, and said, "Judge, I went in this morning just simply to make a neighborly call on that young scamp of a lawyer who has just come into town and he charged me five dollars." "Served you right," said the judge. "You had no right to go to him." "Well, have I got to pay it?" "Certainly you have." "Well, then, if I must, I must. Good morning." "Hold on," said the judge, "Aren't you going to pay me?" "Pay you, what for?" "Why, for legal advice of course." "What do you charge?" "Then dollars." The result of which was the old fellow had to pay five dollars to the young lawyer and ten dollars to the old one.

DENATURIZED ALCOHOL.

There has been so much written and said about the proposed denaturized alcohol as a fuel that the ordinary person feels considerable interest and curiosity concerning it and its practical application. The law which enables this process of denaturing to be undertaken is now in effect and it will not be long before something definite will be known as to the real possibilities in the economy of a household as an illuminating and heating factor. The statement was made some time ago that farmers would not be allowed to have stills on their farms as it would be impossible to have them properly overlooked by revenue officers. On the heels of this statement comes the introduction by Senator Hansborough of South Dakota, of an amendatory bill, which will enable farmers to conduct small stills, the product to be cared for in a prescribed manner so that it will be subject to examination by revenue officials, to see of the process of denaturing has been complete, after which it is the farmers to use or dispose of. This is based on the German system, and is entirely feasible, it is said. Should this bill become a law the refuse of the immense beet product of Orange county would form the basis of an important industry, as it could be utilized for making denaturized alcohol. It certainly is a thing to be hoped for, not only here but all over the land and particularly in agricultural communities.

SOLVED THE PROBLEM.

A street-car horse balked, a crowd collected, and the passengers got out of the car. The driver brought his whip down across the horse's back without effect. A stout man who had just stepped off the car said: "Don't do that, I'll get him started." He rubbed the horse's nose, patted him on the neck, and talked persuasively, all without result. By this time four cars were stalled. Somebody suggested oats, another kerosene, a third a patrol wagon. Another a burning newspaper under the horse. Still it didn't move.

At last a girl of about 13 pushed her way through the crowd and said: " Say, mister, if you'll ring the bell twice the horse will think somebody has just got off, and he'll go ahead."

The conductor pulled the bell and the passengers had to run to catch the car.

PRESS CENSORSHIP.

"Our Dumb Anibals," a most excellent little magazine, published in Boston. has this to say in the January number:

"We are sorry that we have been shut out of the schools of Washington, D. C., because we cannot agree with President Roosevelt in regard to the shooting, wounding and killing of animals simply for the fun of shooting, wounding and killing them."

AUTO-BIOGRAPHY.

An autocrat in an autocart
Wailed: "Oh, this vehicle auto start!
My autotype of the guarantee
Reads 'automatic,' I plainly see.
And if autographs of the makers here
Have auto do with the running-gear,
I'd not be wasting an autumn day
In such a nonautomonotonous way,"
But he sat and sat, in the frosty fall,
Till an autopsy was the end of all.

To Cure a Cold In One Day.

Take LAXATIVE BROMO Quinine Tablets. Druggists refund money if it fails to cure. E. W. GROVE'S signature is on each box. 25 cents.

Sharpened Tools

Ever buy a hatchet that would sharpen a pencil? If you did, it was a Keen Kutter, for every Keen Kutter edged tool is sharpened at the shop. On the other hand —did you ever buy a hatchet that you had to grind before, using, and in grinding find a flaw or soft spot? That is the reason that most manufacturers do not give you a hand sharpened tool. They let you take the risk.

KEEN KUTTER

QUALITY TOOLS

are offered you with every risk of quality or temper removed. Edges are keen and perfect—temper and quality are tested and every tool is stamped with the name and trade mark for identification and guarantee. You don't need to be a tool expert to buy the best tool of any kind. Just ask for a Keen Kutter if you want a Saw, Chisel, Bit, Drill, Gimlet, Awl, Plane, Hammer, Hatchet, Axe, Drawing-knife, Pocket-knife, Screw-driver, File, Glass-cutter, Ice-pick, or any tool for bench, home, garden or farm.

Sold for 37 years under this mark and motto:

"The Recollection of Quality Remains Long After the Price is Forgotten." Trade Mark Registered.

If your dealer does not keep Keen Kutter Tools, write us. Tool Booklet on request.

SIMMONS HARDWARE COMPANY, St. Louis and New York, U. S. A.

F. W. SPARR, 114 E. Market St., Los Angeles

Established 10 Years

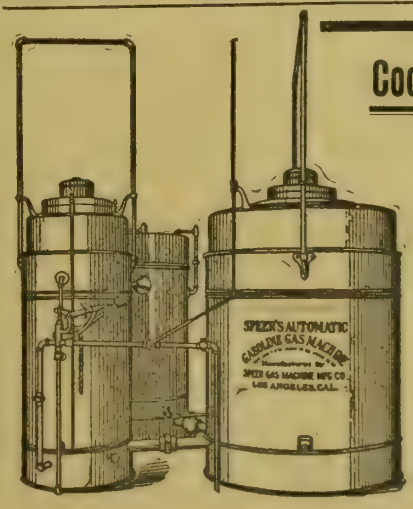
WITH A SIEVERT OIL BURNER

You can burn 100,000 cubic feet of air with every 130 gallons of oil; this means perfect combustion. To burn more than 100,000 cubic feet of air with 130 gallons of oil, there is a decided loss of heat. To burn less than 100,000 cubic feet of air there is a loss of fuel.

The only safe and reliable burner on the market.

Send for full particulars.

SIEVERT OIL BURNER CO. 1001 No. Alameda St., Cor. Main and Ord Sts, Los Angeles, Cal.



Cook With Gas and Save Money

Make Your Own Gas and Save More Money

Little Wonder Engine and Pump

The **Little Wonder** is still a favorite. Those who have used it constantly say "It's a winner." Also that it's true to name in that it is a "Little Wonder." It is a handy little pumping and general utility engine. It will run the pump, feed cutter, the grinder, the churn—any old thing on the ranch.

CITRUS FRUIT SHIPMENTS.

LOS ANGELES, Jan. 21.—Oranges, 58 cars; lemons, 2 cars. Total to date this season, 3076 cars, of which 483 are lemons. Total to same date last season, 4920 cars, of which 684 cars were lemons.

The big rain fall of the week has proved a blessing in a rather unexpected way to the cabbage growers, as it has cleaned the young plants very thoroughly from mites. These tiny foes had made their appearance by the thousands on plants which have been set out less than two months. The big rain has been spraying unnecessary, the bugs having been literally drowned off, and the plants are left in the best of condition.

Incubator on Free Trial

For one, two or even three hatches. We pay the freight. No company could make a fairer offer. We know the Old Trusty will do the work satisfactorily for you and we will take the chances, not you. Send and get the prices on these Incubators and we will make you the lowest price you ever heard of for a first-class Incubator. Now is the time to order. WRITE US TODAY.

RUPTURE CURED By Assisting Nature Alone

Ask Mr. Sornighausen, aged 80 years, 218 E. 30th st., Mr. John Clements, aged 82 years, Hotel Cumberland; Mr. Douglass Maylen, Hollywood; Mr. Louis Fletcher, Mgr. Hollenbeck Cafe; Mr. Joseph Welland, 332 E. First street, and a list of about five dozen more cured people, for the asking. I ask the opportunity of explaining the method. Call or write. You won't be asked to buy.

TRUSSES not alone made to fit, but to wear and hold. I make 15 KINDS, our own inventions, including several new styles, but never elastic trusses. All other mail order trusses are simply common elastic trusses.

DEFORMITIES absolutely corrected and cured with the most improved and comfortable appliances known. Our own invention. I also make elastic stockings, combination, large abdomen, supporting and reducing belts; also eight other kinds of supporting belts. Shoulder braces and Men's Suspensories, appliances and methods to cure the following ailments by home treatment. Falling womb and ovarian pains, floating kidney, navel and after-operation rupture, weak or lame back, leucorrhea (whites) or an irritated condition of the womb or vagina, constipation, itching, bleeding or protruding piles, varicose or enlarged veins, limbs, joints, sprains or dislocations, flat foot, sick headache or dizziness, especially in the aged; varicocele, hydrocele. We also carry complete maternity outfits for confinement cases and all sick room supplies and nature cure utilities for all physical weaknes. We now enjoy a large and satisfactory mail order business in all the varied lines and guarantee satisfaction to you or refund the money. Write us freely.

There is but one disease—Blood Congestion. And but one cure—Blood Circulation.

We have an institute in connection, wherein we treat all diseased conditions and force circulation by natural methods only. Consultation free. Separate rooms for ladies. 15 years' experience along this line.

Irrigation in Central California

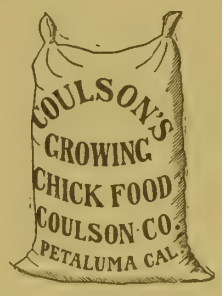
A Laguna Irrigation Canal

WHEN Prof. L. H. Bailey came to California in 1901, he stopped at various points to study local conditions and practices. One man preparing land for irrigation, though all signs pointed to rain, was asked why he preferred irrigation to rain. He answered, "Irrigation is better and cheaper than rain, for several reasons," and proceeded to give these reasons which were good and sufficient.

In Southern California irrigation was practised first as a necessity because of the inadequacy and uncertainty of the rainfall. In Central California, it was not begun so much of necessity as of convenience. The broad acres of the San Joaquin and Sacremento valleys could usually be depended upon to bear prolific crops of wheat and other cereals, and it was only when the greater possibilities of fruit growing had been demonstrated through the application of irrigation that this method of supplying the thirsty soil began to be extensively practised.

These immense valleys had the experience of Southern California upon which to base their operations, for in the south King Water had transformed that section of the state from a desert to a land of gardens. It was not until many years after irrigation had worked this transformation south of the Tehachapi that the general practice reached farther north, and though today the older watered sections are still pointed out as examples of what artificial watering will accomplish, the central portion of the state has by far the most extensive water supply as well as the greatest number of acres which may be brought under its life-giving influences.

But a few weeks ago the Cultivator published extracts from an article entitled, "Wealth in Irrigation," penned a few years ago by an employe of the government, who is still writing extensively on the subject of irrigation. So rapid has been the development of irrigation in Central California that the publication of the comparisons therein set forth has aroused the just anger of some of our good people of that portion of the state, and the justification of their ire appears all the greater when it is readily seen that the author's geography is somewhat mixed. Our state is so vast and so varied in its topography as even to confuse some of our oldest citizens, and an investigator from the national capital cannot be expected to master the problem during a visit of a few short weeks. The fact is that since the first publication of the article in question Central California has become a land of irrigation canals, tapping all her immense waterways, and scenes like the one here presented, of a canal on the Laguna de Tache Grant, near Lemoore, are common sights all over that section of the state. These giant arteries and their tributaries are rapidly transforming the San Joaquin and Sacramento valleys from vast fields of grain into small well-tilled farms, for the thousands of homeseekers who are each year attracted to these fertile sections.



Coulson's Growing Chick Food

Is a mash feed for the growing chicks, designed for feeding when you leave off feeding Coulson's Special Dry Chick Food, composed of articles, each the best in its class, combined in the correct proportion to form

A PERFECT BALANCED RATION

It contains blood meal, meat meal, bone meal, and other articles rich in protein, and the other elements, and is the feed you need to make your chicks excel in size and weight and enable them to become strong, vigorous and heavy-laying fowls.

COULSON'S GROWING CHICK FOOD WINS OUT

San Marcos, Cal, July, 23, 1906.
Gentlemen:

I tried COULSON'S GROWING CHICK FOOD exclusively my first year in business on Brown Leghorns. I sold the cockerels as broilers at nine weeks, averaging 2 pounds, 3 oz. each.

I tried my own mixture of feed the next year and took the same care of the chicks, and sold 75 cockerels as broilers, weighing 105 pounds, making an average of about 1 1-4 pounds each.

Having tested at my own expense the two methods I have concluded that COULSON'S FOOD is superior.

(Signed) J. B. HOOVER.

Coulson's Special Dry Chick Food

Is acknowledged by all The Best and most Reliable Feed for Baby Chicks.

COSTS LESS THAN 2 CTS. FOR FIRST FOUR WEEKS

ONLY HIGHEST QUALITY GRAINS, ETC,, USED

Special Dry Chick Food contains numerous different seeds adapted to needs of the little chicks, besides meal, charcoal, bone and many other necessary articles, each in Granulated form making

A PERFECT BALANCED RATION

CANNOT PRAISE IT ENOUGH

"I cannot say enough in writing in praise of your Special Chick Food. It is just fine. I never saw chicks do so well before."

J. S. SCOTT, Madison.

PULLETS LAY EARLY

"I have fed your Special Chick Food and Growing Chick Food to all my stock with one exception. I tried one lot of 350, and fed them my way of raising chicks back East. Results just fair. The other were fed up to three months on your Special Chick Feed, and the results were a surprise to me. The birds were large and the cockerels out of one lot I sold to the California Market and got a big price, with the request to send on to them at any time I had more cockerels of the same quality."

Respectfully, A. P. WARD,
Calistoga.

USE COULSON'S AND BE SATISFIED

SPECIAL OFFER.

Where Coulson's Special Dry Chick Food cannot be obtained from local dealers, we will ship, freight prepaid to any railroad station in California, 100-lb. sack for $4.00, or 200 lbs. for $7.50, cash with the order.

Riverside Citrus Growers Institute

Notes of the Largest and Most Important Gathering of Citrus Growers Ever Held on the Pacific Coast

By ERNEST BRAUNTON, Los Angeles, Cal.

THE SPECIAL CITRUS FRUIT GROWERS' Institute held at Riverside during three days of last week proved to be the largest, most important, most enthusiastic gathering ever witnessed at a Farmer's Institute in this state. Every important center of the citrus fruit industry was represented and few sections south of the Tehachapi were unresponsive to the call. It is safe to say that all the big men of both orange and lemon growing were there, or if they were not, so many of them were present that the absentees were scarcely missed. Enthusiasm was at all session clear to the top-notch, all visitors seeming elated because of such a notable and representative body, and nothing happened during the whole meeting that anyone present would recall or that gave rise to the least regret. The profit and pleasure of this institute will linger, pleasantly, in the memory of all present, both participants and onlookers for many a year and history will be able to record at least one gathering of fruit growers that fully met all expectations.

Tuesday, Jan. 22nd.

The first day's program commenced at 1:30 p. m. with Mr. J. B. Neff, Conductor of Farmer's Institutes in Southern California, in the chair; Mr. T. C. Evans of the Riverside Chamber of Commerce as Secretary and Mr. S. D. Pelton as special institute stenographer. Mr. J. H. Reed, who is, and has ever been, first and foremost in all good work for the interests and welfare of Riverside and vicinity, delivered a rousing address of welcome which evoked hearty and spontaneous applause. This excellent address was all too long to reproduce here, but the ground he covered included nearly everything that could generally be said in regard to the citrus growing industry and is fairly outlined in the following short extracts:

"The foundation of the prosperity that has made it possible to gather about us and about you in your towns, the comforts and esthetic features that add to the satisfaction of living, has been, and is, in our orchards, and we are here met today to consider what we believe may prove important factors in perpetuating the prosperity they have given us. It is the part of wise business to carefully scan the future conditions that may effect it, whatever the present may be. . . . . Its present prosperity may be directly traced to natural conditions, to intelligent labor, to organizing ability. Certainly not to improved quality of product, not to economy of production.

In our efforts to advance our industry we have secured quantity, but not quality. That the easy conditions which have secured favorable results on the whole, are rapidly changing, I think no one doubts who has given the matter intelligent attention. . . . . Now, what are the real conditions we face even in the near future? A large annual increase of product from our own plantings—an increase of not less than 40,000 cars before the first decade of the new century closes—I believe a conservative estimate. Were present financial prosperity over the country ensured to that time the increase in consumption at present quality and prices possibly might keep pace with the increase of product. But I do not believe sagacious business men in other industries will base future plans on indefinite continuance of present phenomenal prosperity."

Following Mr. Reed's address came an outline of the purpose of and the particular lines of work to be carried out at the new Citrus Experiment Station at Riverside. This task had been assigned to Prof. E. J. Wickson, but owing to delay of trains was ably disposed of by Prof. Ralph E. Smith, who has charge of this station and the laboratory adjunct at Whittier.

The "Symposium on Success with Lemons" was opened by R. C. Allen of Bonita, San Diego county, in an instructive practical talk from his standpoint as a grower and manager of large acreage. He suggested that the new citrus station should be on lines broad enough to admit of experiments with the several standard varieties of lemons.

H. B. Hampton of Corona presented his views on the subject from the growers' and packers' standpoint.

C. C. Teague of Santa Paula, one of the most successful lemon packers and growers in the state, gave practical hints from his own experience and touched upon the subject of picking and care, based upon the unusual success he is known to have attained during the past few years.

C. C. Chapman delivered a very felicitous address upon care of fruit from orchard to car, which was received with much interest, and said by all whom the writer heard express an opinion, as being Mr. Chapman's masterpiece among his many institute talks.

Mr. F. A. Little, a little late on the program, also gave his experience in the care of lemons in shipping. No report of the institute would be complete without mention of Kenneth MacRae of Rialto, who spoke on several topics under one general head and provoked considerable laughter by his sallies of wit.

In the evening the secretary read a paper on "The practical value of scientific work as illustrated by the commercial results from G. Harold Powell's investigation, written by Mr. B. A. Woodford, Manager of the California Fruit Growers' Exchange. This was a condensation of the many reports of Mr. Powell's work, which has from time to time appeared in the Cultivator. At the outset Mr. Woodford paid high tribute to Mr. Powell's work and especially commended Mr. J. H. Reed, who was mainly instrumental in getting the Agricultural Department to send Mr. Powell to California.

In the discussion following Mr. Woodford's paper, the opinion was unanimous that Mr. Powell's investigation had been productive of the best results in preventing damage to fruit in picking, hauling and handling fruit in the packing-house. The damage by picking was not by any means all done by hired pickers, but in one special case where the owner picked himself there was 65 per cent. of one load of fruit damaged. The remedy recommended was careful supervision in the orchard and everywhere else, and day work in place of piece work.

In the absence of Benjamin Ide Wheeler, C. C. Chapman was called on, to talk on orchard management, which he discussed under five heads, namely, cultivation, irrigation, fertilization, pruning and insect pests. He believed in thorough work and insisted on it on his own place. Deep furrowing for irrigation, plenty of water while being applied. After that, deep and thorough cultivation. The same rules apply to fertilization. Liberality in quantity of all the three essential elements. Pruning was necessary to produce abundant crops of fine fruit, and the best results could not be obtained unless insect pests were kept under, and the best way to fight them was to fumigate.

Wednesday, Jan. 23d.

Wednesday morning's session opened at 8:30 o'clock with a question box conducted by J. B. Neff, the director of the institute and was participated in by a goodly number, covering many important problems and topics.

A practical discussion on the question, "Has Any One Shown in Actual Experience What Are the Specific Requirements for Securing a Larger Proportion of Finest Fruit?" was led by C. E. Rumsey of Riverside and was listened to with marked attention.

C. C. Chapman of Fullerton, who has made the Old Mission brand of oranges famous, added his experience in securing fancy fruit, to which everyone listened most intently, for Mr. Chapman bears the enviable distinction of receiving more for his fruit than any grower in the state, and all were listening for something unusual and startling to drop. It didn't happen.

Matthew Gage told of experiments in growing for size, and asked if there was not danger of getting too large fruit by pruning. Mr. Chapman was of the opinion that pruning developed more fruit as to number, rather than size.

E. A. Meacham said that of all experiments in bettering the quality of fruit, the one he had found most successful was that of giving one heavy irrigation each year, with the lighter ones. This eliminates the plow sole. His longest irrigation was thirteen days at one time.

Next followed a paper on Experiment Stations, by Prof. A. J. Cook of Claremont, which contained many good points and was listened to with close attention. He was followed by Prof. C. R. Paine of Crafton, who read a paper on "Practical Problems for Solution by the Citrus Experiment Station."

Prof. Paine has grown a large variety of citrus fruits on an extensive scale for many years past.

After the recess at noon J. H. Reed read a report from the committee on a permanent organization of citrus growers in the State of California, which is as follows:

Your committee respectfully recommend the formation of a citrus Growers' Association of California. Its purpose to be by organized effort the betterment of citrus growing interests.

Deciduous Fruit Culture

By J. W. MILLS

THE HOME ORCHARD.

IN ONE sense, the home orchard is the most important part of the farm, because it is a part of the home. It is, however, sometimes the most neglected part of the place because it brings in little if any cash, but it saves cash and furnishes comfort and good things to look at and eat. These prerequisites are not always sufficiently appreciated.

Unless there is an abundance of land that may be used for the purpose, it is a mistake to cover too long a list of fruit trees. One tree of each of a few of the best varieties selected so as to follow one another in ripening, even if there is an occasional gap between ripenings, is better for a small lot than to have a long list crowded together.

Trees may be planted closer together in the home orchard than in a commercial plantation, say sixteen feet should the area be limited, but when land is no object, twenty feet is better. Where the space is limited, it is better to plant large and small growing varieties alternately. For instance, apples and peaches may be so planted. The peach is a short lived tree and the apple, besides living to a good old age, spreads out and occupies considerable space when comparatively young. After the peach trees have passed their usefullness, the apples will occupy the space.

Apples and pears are often grown as dwarfs for the home orchard. Pears are dwarfed when grafted on quince stock. Paradise stock makes a dwarf apple tree and Doucine makes a half dwarf. Paradise stock is much liked by woolly aphis and is undesirable on that account. However, if Northern Spy apple is grafted into the Paradise and the variety desired onto the Northern Spy, good results should be obtained. Apple trees are pruned to root above the graft if set with the union below the surface of the ground. I consider this a good combination for trees in a home orchard, for quick results are obtained. Quite a quantity of apples and pears will be had the second summer and if the trees are planted with the union above or below the surface, they will eventually develop into standards, and in later years make large trees. After the Northern Spy stock developes, becomes well rooted, the dwarf roots may be cut out and thus remove posible bait for the woolly aphis.

Grape vines are grown to advantage as an arbor or on a fence. Berry bushes should not be grown against a fence as it is difficult to gather the fruit from one side of the row.

A good selection of fruit for a lot that would accommodate a dozen trees, would be as follows: One Red Astrachan and one White Winter Pearmain apples, one Lawson and one Easter Beurre pear (of course Bartlett is the best pear, but it is too subject to blight to be risked for the small plantation.) Tragedy Prune and one Wickson or Kelsey plum, one Royal apricot, one Stanwick nectarine, one Admiral Dewey and one Lovell peach, one Angelique fig and one Placentia walnut. This makes one dozen trees that will give fruit all through the summer. There are excellent eastern varieties of peaches that are not for sale by California nurserymen, but can be had from some of the eastern nurserymen. Some of the nurserymen at Glen St. Mary in Florida have them for sale. Some of these are Large Early York, Coolges' Favorite, Mountain Rose, Honey and various other kinds. These peaches far surpass the standard varieties of yellow peaches. There is no better flavored peach than Stump the World, or Belle of Georgia, still they will not do for a market peach as they will not carry. Chinese Cling and Old Mixon Cling are much higher flavored than any of the yellow varieties of canning peaches, but they will not do for the trade as they have a bad color imparted by the red flesh near the pit. The former is a shy bearer, the latter very prolific. These clings have a nutty flavor not found in the yellow clings. None of the white freestone peaches have good market qualities as they are too delicate in flesh to stand handling that market varieties require. They are also much more delicate in flavor and this is why they should be used in the home orchard.

For a home orchard of considerable size, an unbroken line of peaches may be had from the following varieties. Admiral Dewey, Amsden's June, Large Early York, Early Crawford, Foster, Coolege's Favorite, Lovell, Belle of Georgia, Stump the World and Salway.

Plums from May to October, are Chevy Plum, Rivers' Early Prolific, Tragedy, Bartlett & Wickson, Kelsey, Sultan and Rien Claud Bavay.

Apples, Early Harvest, Red Astrachan, Duchess of Oldenburgh, Rhode Island Greening, Yellow Belle Flower, and White Winter Pearmain.

Newcastle, Tilton and Royal will supply apricots through their season.

Figs from late in June till January will be supplied by Gros Gris Bifer, Angelique, Mission, White Datatto, and Verdal Longue.

I have not mentioned cherries as they are counted out in the valleys of Southern California. Experiments scattered over a wide area show that there are not to be relied upon and in fact are a decided failure.

One Smyrna quince, one Hachuja and one Hyakume persimmon, one Spanish Ruby and one Wonderful Pomegranite, one Advance loquat, one Lewellings Porlific and one Languedock almond, one Stanwick nectarine, one Santa Catarina and one Mission olive will complete the list that will keep the family in fruit throughout the year. I have not mentioned citrus fruits as they are all common to us. A St. Michael orange may not be out of place in with the Washington navel and Valencia.

A good list of grapes is Chasselas Rose, Blue Portugese, Black Malvasay, Cinsaut, Purple Damascus, Muscatello fino, Muscat, Olivette, Verdal, Tokay, Cipro Hero, Golden Queen, and Black Morocco.

WINTER INJURED TREES.

A number of inquiries have come to the station from a few fruit growing districts in New Mexico in regard to the treatment for winter-injured fruit trees. The sudden and severe cold spells during the earlier part of the winter found a "number of apple trees not ready for winter" in the eastern part of the territory.

Excessive cold is likely to injure trees and especially if the young growth has not properly matured durthe fall and early winter. The more thoroughly matured and dormant the plant, or part of the plant, the better it is able to endure severe cold. Fruit growers in the colder parts of the territory should see that the new wood is thoroughly matured before frost come. The wood can allowed to mature by lessening the activities of the tree in the fall. This is usually done by stopping cultivation and irrigation at the proper time. Cover crop, also, tends to mature the young tree growth.

While the proper treatment for winter-injured trees is often determined for each particular case, it is true that the injured part is no longer of any use to the tree, vine, or plant, whereas it may cause positive injury by accelerating the evaporation and dying back of the frozen parts, or by affording lodging places for insects and germs of plant diseases. Probably the best treatment for trees and vines that have been winter-injured upon the new growth or extremities is to cut them back as much as necessary. The severity of this operation, which may be 3 to 5 feet, depends upon the injury. The removing of these dried and injured tops concentrates the energy of the tree into a smaller area. It is to be remembered that heavy pruning always tends to produce vigorous new growth and this new growth is much needed in winter-injured trees, as the vitality of the trees may be renewed. The injured wood can never perform its former function in the growth of the tree. New wood must be developed as soon as possible in order that the tree may maintain its vegetative forces.

When writing advertisers mention Cultivator

Sometmes the heavy cutting back of winter-injured trees seems to do more harm than good, but the death of such trees would have occured even of they had not been cut back. These are cases where the entire tree has been injured.

All the injured wood should be cut off and the pruning should extend down to the uninjured part. The wounds, especially if they are any ways large, should be properly covered with some kind of dressing. Paint and tar are good materials.

There seems to be a variety of opinons in regard to the best ti of the year to prune the winter-injured trees. Some prefer to wait for the starting of the buds, rather than prune earlier in the spring. Others prefer to prune in the spring before the buds open. However, it is believed that where zero weather is not likely to prevail that as good results may be had by dong the pruning shortly before the leaf buds open in the spring.— Fabian Garcia.

TOP-WORKING PECANS.

Interest in the pecan industry is steadily increasing, not only in our own state, but in others as well. Since the writer has visited many pecan groves of the state during the fruiting season, and has been forcibly struck by the fact that very large numbers of small, inferior nuts are produced. This is not as it should be, and the fact that such is the case is but proof of planting nuts or seedling trees. These are seedling groves and doubtless they are the outgrowth of the very best selected nuts. True, a considerable proportion of seedling trees produce good, sizable nuts, but scores produce inferior nuts, but little larger than chinquapins, and it is a fact which cannot be gainsaid that the seedling pecan, up to the time of fruiting, is an unknown quantity, after which it is too often a disappointment. It is not necessary to say that such trees are unprofitable, and the question naturally arises, what is to be done with them? Only two answers can be given; one is, cut them down and plant budded or grafted trees of desirable varieties. The other is, top-work them. It is needless to say choose the latter, but do not work over all the trees in the grove simply because they are seedlings. Those which produce a goodly quantity of marketable nuts should by all means be allowed to remain; top-work the remainder.

"LET US IRRIGATE."

In Jan. 3rd, Cultivator, page 23, is an article; "Wealth in Irrigation," in which the writer says. "In the San Joaquin valley no irrigation has been developed and the land is planted to vast fields of wheat, resulting in an entire lack of settlement of the valley."

This statement shows the writer is grossly ignorant of present conditions in this valley. It is true we have large fields of wheat, of which we are justly proud, but the hundreds of thousands of acres of irrigated vineyards, orchards and alfalfa, under the best and cheapest irrigation system in the state, most of which is owned in small ten, twenty and forty-acre tracts, on which thousands of happy and prosperous families make their living, the great citrus belt on the east side of the valley in Fresno and Tulare counties, and the many rapidly growing cities and towns in the valley, are the pride of everyone who is broad-minded enough to be a Californian. If the writer of the article will take a trip through this valley, though he be a Missourian, I believe he can be shown. —W. E. Thompson, Oleander.

The article above referred to, was a condensation of one written by a government employee a few years ago when conditions were not quite so favorable to the part of the state where our correspondent lives, at least in regard to intensive farming and irrigation. Then, too, the author is only speaking in a comparative sense and was but making the point that irrigation had practically reclaimed the south from a desert and that nowhere else in the state was it properly appreciated. We are pleased to publish the writer's well-taken correction regarding one of the choicest sections of our great state and the "irrigations" are "on" the Cultivator.

Largest National Bank West of Denver and South of San Francisco

First National Bank

United States Depository for Government Funds

TOTAL RESOURCES, $20,000,000

ADDITIONAL ASSETS—One Million Five Hundred Thousand Dollars invested in the stock of the Los Angeles Trust Company and the Metropolitan Bank and Trust Co., and held by the officers of the First National Bank, as Trustees, in the interest of the shareholders of that Bank.

Toronto, Can. WEST CHESTER, PA. Chicago, Ill.

Southern Chief DISC PLOWS

Built with Special Reference to the Requirements
:: of PACIFIC COAST Farmers and Orchardists ::

These plows are made entirely of steel, malleable and cast iron. They are well braced, strong and easily controlled. The three disc can be converted into a two disc, and the four disc is easily changed into a two or three disc. A farmer having a two disc can make a three disc by securing the extra parts.

LEVER RODS SLIDE THROUGH ADJUSTABLE CONNECTIONS
Keeping the Levers and Operator Always in the Same Relative Positions.

The location of seat, wheels and hitch are right, giving good penetrating power and permitting of turning to either right or left. The front wheel is under control at all times and the plow can be steered at will.

The Orchard Axle Attachment

with which either size of these plows can be equipped is a splendid thing for orchard plowing, and especially where it is desirable to work up under the branches close to the trees.

Permits of Closer Work than Can be Done with a Walking Plow

The plow with this attachment can be used for general work as well as for orchard plowing.

Made in Two, Three and Four Disc

SIMPLE WITHOUT SACRIFICE OF STRENGTH, AND THE QUALITY OF WORK CANNOT BE EXCELLED BY ANY DISC PLOW AT ANY PRICE

All levers are convenient for the operator, easy to control in raising or lowering plow and for guiding purposes. The bearings are long and made of chilled cast iron, insuring wearing qualities. The foot trip for rear wheel permits the plow to turn either way, and also serves as a raising lever. The method of raising and lowering front furrow wheel is sure to be a source of delight to the operator. It does away with the inconvenient lever in **general use**, which is usually too **long** on a **two disc** and too **short** on a **three disc**. The elasticity of the spring board hitch relieves the plow of dead shock and severe strain.

ASK YOUR DEALER TO SHOW YOU THESE PLOWS

Send us your name and address, enclose four cents in stamps to pay postage and mailing and we will send you our Flying Dutchman Song Book and Junior Catalogue Combined, containing Twenty Old Familiar Songs with words and music.

MOLINE PLOW CO., MOLINE, ILL.

Live Stock and Dairy

By Mrs. Minna E. Sherman, Fresno, Cal.

DIGESTION OF THE COW.

GREAT individuality in a cow is not desirable, except it is toward higher production.. If the time ever comes when a cow's disposition and personality is carefully considered and every thing she does not like kept away from her; if she is placed under ideal conditions, if her nerves are considered as race horse men consider a horse, then we will see some marvellous records made of butter production. This will be expensive but it will be practical work, not sport, as the race horse is the least useful and most degrading of all horse flesh to his human associates, while the making of a great butter or milk record is a distinct advance of the breeder art, even if the common milkman can never hope to reach the mark.

The building up of a herd of cows has more than the amount of butter fat to consider, the cows must have health or their milk is not saleable. Health can be carefully bred and carefully cultivated. What regularity of habit does for the human race was never so well set forth as in the experiment made by Prof. Wiley, in Washington, along the line of the pure food work. In this case the young men were fed on the food well prepared and given with it a capsule containing the usual amount of preservatives used by the canners and meat men. The young men were selected as those whose honor could be trusted to eat nothing away from the diet table. The experiments were expected to prove conclusively that digestion is greatly disturbed by the use of preservatives, that regular eating, of correct amount of nutriment according to the physical requirement of the individual is the one thing needed. The men did not show the bad effect expected. The regular well prepared food, right in its amount, actually came very near to off setting the drugs fed with it.

Whenever we take to breeding cows by the Babcock test alone, not considering the animal as an animal, whether it is in balance, with proper heart, lungs and stomach, to carry on the functions of its life, as well as to produce milk and transmit health to the offspring, the danger line is reached. The building up of a herd of cows has to be considered from all sides, or else the old story of tuberculosis comes in, and the cows valuable as heavy fat producers today, are tomorrow worthless.

That tuberculosis is contagious, not inherited, is nearly a sure fact in the minds of the scientific men of today.

Home of Bacillus.

The home of the orignal bacillus is now thought to be in the hay fields, but now become so generalized that it abounds everywhere man is found. The Bangs method of raising a healthy herd from the diseased cows, by removing the calves as soon as dropped by the reacting cows, is being carried out, removing them as completely as the Spartan did the child from their parents, and rearing them on sterilized milk, to make them healthy. This under trial for a period of years, has demonstrated itself as far as eliminating tuberculosis is concerned, to be successful. I wonder if the calves produced by cows in advanced stages of the disease have the same sound nervous system as the calves born of healthy cows?

Nerve Force of Cows.

The nerve force of the cow is shown in her increasing milk secretion. A cow without nerve force is not a heavy producer of milk. Study this difference at the next agricultural fair by examining the beef and dairy cows. The only vital difference that you can see is that the one has every appearence of nerve force and would stand up under trial. The cow has the look of grit. While the sleepy beef cow looks as though the hardship would quickly kill her. She has not the ginger or vital force to take hard usauge that is written on every line of the expressive face of the dairy cow.

Nerve strength is balance. It does not mean the easily frightened cow or the vicious one, but a calm, clear eyed reflective look that measures quietly the sources of danger before moving out of the way. The milking machine will weed out the cow of peculiarities, the merely cranky one, for it is unyielding. The human milker made allowances. The cow must now come to time and any Zantippe like conduct will bring her to grief, when the Babcock tests her milk. Nerve force in the cow means continuous results in the milk pail. The flabby cow may like the flabby man, run well a short race but nerve force in man or beast means effectiveness. The Zantippe cow like the Zantippe women, must not be excused but must be eliminat-

Standard Reached.

Cow feeding has been standardilzed by taking a large number of herds and studying the results of ration feed. The amount that it was profitable to feed was thus arrived at. This is the scientific way of feeding. Many dairymen do not believe as yet in it, but do believe in the "cow sense" of their cattle. They believe the cow knows when she has had enough of one feed, and that the kind she prefers is the kind she should have. They believe that cow instinct cannot be improved upon in any way. Now if the cow could be further educated to read the market reports and use the cheapest foods to produce a pound of butter we might trust her with the feeding business. We also know if we should buy her all the different feeds that are mixed for a ration and spread them out, allow her to come in and eat what she liked best, that the oil cake would go first and a very sick cow would be the results.

The idea of cow sense comes from ignorance, it is surprising how ignorant people can be of what they see every day. I have never asked an audience of dairymen how many pound of hay their cows ate at a meal and had them tell me correctly? They guessed each cow ate so much. The chances were, if those men weighed the hay, they spread out before the cows and the amount the cows leave that they would find the cows were over fed on grain, for the cows will take grain and leave hay or roughage. This goes on until the cow is being fed too expensively and wastefully.

Know positively that the cow is taking two-thirds of her available nutriment from the coarse fodder, hay, corn stalks and silage are considered as roughage. Nearly all the cow udder and digestive troubles come from a failure to recognize this fact. Do not guess but weigh the hay and grain for several days and see how nearly right you are feeding. In weighing, weigh all the cow leaves uneaten, cut out the grain feed until she eats the hay portion completely. I do not believe you will ever regret the labor, for the cow will give as much milk at a decreased cost. The knowledge gained will not be the least part, for instead of having a cow off her feed every now and then, the cow will be little trouble and keep in good health all the time.

HOMOGENIZED MILK.

The great importance of cows' milk for human food is being advanced by new methods of modifying its composition. One of the most recent inventions is that of homogenizing milk, a process by which the fat is put into complete emulsion with the milk serum. In plainer words, the little butter fat globules which exist in milk and vary in size from one five-thousandth to one twenty-five-thousandth of an inch in diameter are broken up into

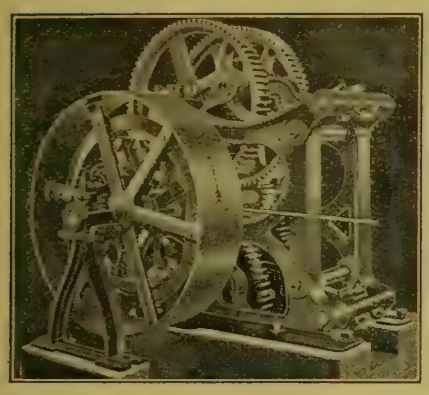
The Pomona Pumps Are Best



for City Waterworks and Irrigation

BECAUSE—

Using machine cut and slow running gears, they are

PERFECTLY NOISELESS.

They use stepped gearing with no break in the tooth contact, doing away with all rattle and vibration.

BECAUSE—

They have an ideal motion of the pump rods, which consists of a uniform continuous slow up motion, a smooth, quick down movement with absolutely no jerk in starting the rods upward eliminating all rod breakages and valve troubles.

BECAUSE—

They will save you money in cost for power. We use machine cut gearing which alone saves ten per cent. We have a leverage in our gearing which other pump makers do not have and which they do not tell you about when trying to down us.

BECAUSE—

In pumping through long pipe lines, they deliver a continuous steady stream.

They do not hammer out your pipe line by irregular pulsations of the water column.

They save power by keeping the water in continuous motion.

BECAUSE—

They are fitted with improved oiling devices that can be filled without stopping. Pumps may run for weeks continuously.

BECAUSE—

We have advantages in our pumps that investigators appreciate at once, consequently, where one goes others follow and we are fast taking the country.

BECAUSE—

We give a guarantee of satisfaction with every plant.

Send for catalog.

Pomona Manufacturing Company

Makers

Pomona, California

still smaller globules and thus form an emulsion which will not separate by gravity or centrifugal force. The homogenizing of milk is a simple process by which it is forced under high pressure against a hard surface, causing the fat globules to be broken up into extremely small particles. A pressure of from five to six hundred pounds to the square inch is required and the streams thrown are about the size of a pin point. Milk which has been thus treated will not cream or even churn, but remains constant with whatever per cent. of fat it may contain. It is claimed that homogenized milk is more easily digested than that untreated.

Queries

Citrons for Feed.

Please answer.—Are citrons good cow and hog food?

I know one farmer who says they are fine feed for milk cows ,and that hogs fatten readily on them, while the man on the adjoining farm, claims he would not feed them unless he was short of water, as that is all there is to them.—G. A. O.

Succullency added to dry feeds by any means increases the milk flow in cows. Corn sileage, actual chemical feeding value, does not indicate the value it has when fed to a cow. Citrons have little food value chemically compared to grain. The one neighbor who fed the citrons with plenty of grain and dry feed found them of great value in assisting the cow to make use of the nutriment in the grain. He increased the assimilation. The other neighbor probably fed them straight or without sufficient grains, and as he says, found that they were little better than water.—M. E. S.

Swelling Near Navel

I have a large Durham cow about eight years old that has a large swelling just in front of her udder and back of the navel. It is about the size of a 5-pound lard pail; quite hard, but doesn't seem hot or feverish, but is quite sore. It came during one night about two months ago. There was nothing to indicate a hurt of any kind. She was kept in stable during the night and turned in a yard during the day. While in the stable she had plenty bedding. She is kept alone as I haven't any other cows. She shows signs of being in pain. We have bathed it in soap and water and have used turpentine and olive oil quite faithfully. Can you tell me what is the trouble and the best treatment to give for relief? Any assistance you may be able to render me will be very thankfully received.—R. H. R., Elsinore.

This lump should be examined carefully to see if it is a hernia, I have had two cows strain themselves and produce rupture. This was cured in one case by cutting through the skin and pusning back the bowel, then sewing the break up with silver wire. The cow was kept bandaged to prevent further trouble for several months. The other case the hernia was softened with hot water and the cow having been thoroughly physiced the day before and left for twenty-four hours without any food, so that the bowels were practically empty. A large pad of felt was cut and fitted to hold the hernia up, then a web surcingle was strapped closely over the pad. This answered for six months the cow was fattened and dressed for beef. This lump may come from cold, or from lack of regular or clean milking. I have seen cases of it occur where cows were dried off when the milk flow was too great. In these cases we try to suppress the milk flow by using spirits of camphor to bathe the udder. Give Epsom salts every other night in pound doses with a tablespoonful of ground ginger added. Give this for one week. Give alfalfa hay and bran, no other grains, green grass in limited quantities only. If this lump is going to abcess, it will in all probability spoil the cow as a milk animal as it is probably directly in the way of the milk veins.—M. E. S.

Slobbers.

Can you, through the columns of the Cultivator, give me a remedy for a horse that slobbers?

I have only had him a year and a half, so do not know whether he has

Now is the time to go for gophers with **Bille's Gopher Poison.** The gophers go for it and it will go for them good and plenty every time.

This is a photo of 201 killed in one day on a ten-acre field before they could get back to their holes, wi h one bottle of

Bille's Gopher Poison

Endorsed by Agricultural Colleges and Experiment Stations. Not one of the ordinary poisons, but in a class by itself. Has had greatest success in the Middle West. The secret being that it is most attractive to gophers, squirrels, etc., and sure death to them. It gives the grain a glossy coating, retaining the poison for weeks. Hundreds also die in their holes by eating it there. We have bought the patent rights for this section and are selling at the eastern price of $1.25 for large bottle. The ingredients cannot be bought at a drug store for that price. Money refunded if not as represented—so printed on the bottle. If your dealer does not keep it, send $2.50 for two bottles, express prepaid by us. Any way send for circular with affidavit of above killing and a few out of many testimonials.

Leffingwell Rancho, Whittier, Cal.

Make Dairying Pay
Just consider the part the cow takes as a producer for the farm. She not only furnishes in milk many times her own weight in a single year, but reproduces herself annually, and her off-spring is either sold to the butcher or raised to go through the same process of production for perhaps twelve or fifteen years to come. But to keep cows or run the dairy requires care. You can't have milk without furnishing its equivalent—feed. And the skillful dairyman will carefully increase the ration for his cows until he finds the limit of each animal's digestion. At this point is where the profit lies.
Difficulties, however, are often encountered in arriving at the digestive capacity of a dairy cow. Going off her feed, Indigestion, Milk Fever, Mammitis are the consequences, but where the proper tonics are administered the digestive organs are strengthened and improved and the largest possible amount of food is digested and converted into milk.
DR HESS STOCK FOOD A TONIC
is the medicinal stock tonic and prescription of Dr. Hess (M. D., D. V. S.). Is especially designed to make cows give more milk, market stock grow faster, horses do more work, and to relieve minor stock ailments. It is not a food in itself but makes all the food of the farm produce more milk, more meat and more work.
Professors Quitman, Winslow and Finlay Dun, the most noted medical writers of the age, tell us that bitter tonics improve digestion, iron makes blood and the nitrates assist nature in expelling poisonous material from the system. Such ingredients make up Dr. Hess Stock Food—Isn't this pretty strong proof? Sold on a written Guarantee.
100 lbs. $7.00 25 lb. pail $2.00
Smaller quantities at a slight advance.
Where Dr. Hess Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our Government recognizes Dr. Hess Stock Food as a medicinal tonic and this paper is back of the guarantee.
Free from the 1st to the 10th of each month—Dr. Hess (M. D., D.V.S.) will prescribe for your ailing animals. You can have his 96 page Veterinary Book any time for the asking. Mention this paper.
DR. HESS & CLARK, Ashland, Ohio
Also manufacturers of Dr. Hess Poultry Pan-a-ce-a and Instant Louse Killer. Instant Louse Killer Kills Lice.
THE PETALUMA INCUBATOR CO., Petaluma, California, Pacific Coast Distributors.

always been so. He is now thirteen years old, is of a "boney" build, so never looks real fat, but at times gets in quite good order ,then takes a spell of slobbering, which lasts several days. His hay will be as wet as if a pail of water had been thrown on it and smells badly. He then looks very thin and stumbles. He stumbles some at other times, but always worse when he has one of those spells. He does not go lame. He is fed mostly on tame oat hay.—S. J. L. San Diego.

The teeth should be looked at by a qualified horse dentist. It pays will to keep the sharp points of horses teeth filled smooth. It also pays to fill any teeth that are decaying with amalgam fillings. The bad smell would indicate nasal discharges. These are hard to cure in a horse, with them there seems to be headache and the eye sight is affected slightly. The horse lacks ambition, will not pick up his feet and blunders along the road. I had a work horse that became offensive in the stables, he was tested with malin, but did not react, therefor we did not fear glanders. He was bad enough at times to pitch headlong on the road. I had him humanely destroyed, the bones of his skull were softened and the nasal bones were decaying.—M. E. S.

Scours.

I have a horse that is bothered some with scours and would like to have you give me a good remedy. Have had his teeth fitted up and have fed two or three kinds of condition powders. He has been fed on alfalfa hay, oat hay, and barley, but it seems to be the same in all feeds.— C. B. S., Weston.

The scours are often only a sign indigestion. There is a type of potbellied horses greatly given to scouring—every drive—give a drink of water and the horse scours. The best thing I know of it to avoid buying this style of horse. The next best is to add a teaspoonful of bi-sulphate of soda to the grain feed. Make him eat slowly, by putting a number of common round boulders the size of a man's fist into the feed box. He cannot then grab his food and bolt it by the mouthful, but must roll the boulders around and take the grain in little nips. Avoid giving him a large amount of water at one time, water often and not too much at a time.—M. E. S.

Scours.

I have a horse nine years old that scours very badly, water running from his nose most of the time. He has been in my possession one month, former owner claims the horse never scoured while he owned it, although he fed it very poorly and worked it hard. I am feeding it good, clean oat hay, and four quarts of middlings and shorts mixed, each day. What can I do for it?

Have the horses teeth examined and floated if necessary. Try rolled barley and coarse bran instead of middlings and shorts. Water before feeding; giving no water for at least two hours after feeding. This in most cases affects a cure. If the horse should still continue to scour give tablespoonful of willow charcoal and powdered chalk, once or twice a day.—W. J. Oliver., V. S.

Bloat.

I have a cow that bloats quite easily, and we have to be very careful about feeding and watering. What will I give her when bloated? Can I give her treatment that will prevent bloating? Please advise through the Cultivator. —E. S. F. Redlands Cal.

This cow should have baking soda, a teaspoonful to a tablespoonful night and morning, then feed her easily digested food. A little oil cake acts admirably in these cases, a handful in each feed; it pays also a good return for the money invested .

Common Sense In The Hennery.

The American hen is the greatest bird in the world. All the gold and silver mined in a year, added to the value of sheep and wool, doesn't equal the money worth of poultry products Biddy produces in 365 days time. That sounds big, but it's a big fact and can't be expressed in small figures. If it's hard to believe, take the same truth in another way. Think of a railway train 900 miles long, composed of 107,813 cars. Well! If all the eggs produced on Uncle Sam's farm in one year were packed into crates containing 360 eggs each, it would take just such a train to transport them all between any two points. Now, what about our hens? Nothing small in the poultry industry is there? No, there is not, and if every man with a hen used Dr. Hess Poultry Pan-a-ce-a, giving a small portion every day in soft food, the business would be far more colossal than it is. Pan-a-ce-a is the key-note of success in poultry culture.

Some breeders, crusted with barnacles of old traditions and prejudices, think hens and corn are the only two things necessary for making money out of eggs, Some, again, think there may be something in the "tonic idea" but lack sufficient faith to try it. And in the meantime, while these men are growing poorer, thousands of others, with a full knowledge of what hens require, are giving Poultry Pan-a-ce-a and coining money. Poultry Pan-a-ce-a is not a stimulant. It doesn't force the hen to a short period of large production, only to leave her exhausted for a longer time.

Poultry Pan-a-ce-a gets at the root of the trouble in another way. It makes the hen feel natural when her whole environment is contrary to nature. If at liberty to scratch and forage at will, she would find in Nature's lavish providing most of the things she needs to providing most of the things she needs to promote the healthful activity of every organ. But, being restricted in range, she needs Poultry Pan-a-ce-a to take place of nature's providing by taking food available, and by strengthening and assisting the digestive process till the largest possible amount of nutrition which nature can use is wrung from the food eaten, and directed into proper channels for building healthy flesh or producing eggs. This statement of fact is not overdrawn—unless a preparation of this kind is given.

The truth of all this is sufficiently evident in the number of deserted and abandoned "coops" one sees about the country, where people have literally killed the hen which laid the golden egg by requiring the impossible and unreasonable. Dr Hess and Clark (who make Poultry Pan-a-ce-a) are so well assured of the real value of the compound, that they back it with their personal guarantee—no profit from using Pan-a-ce-a—no pay. If you try it and are disappointed, you get get you money back, that is their offer.

Very likely your dealer has Dr. Hess Poultry Pan-a-ce-a; if not a postal order will bring it. Thousands more are using it this year than ever before. Try it yourself—get in line for prosperity.

"Is she able to get money from her husband without asking for it?"

"Yes, but she had to divorce him in order to accomplish it."

The Vegetable Garden

By ERNEST BRAUNTON

NEW STRAWBERRIES NEEDED.

OUR LEADING strawberry growers tell us we have need of other berries to supplement the well-known Brandywine in-as-much as that popular berry will not furnish us with fruit at all seasons of the year and is not always of good quality when available.

That the Brandywine is not a good early berry is conceded by all. During the early part of the season down to April it remains green and hard on one side, seeming to need a warmer atmosphere for perfect development and ripening.

We have lately seen two berries that would appear to be coming into favor—the Klondike and the Senator Dunlap. The first is a large, round, prolific berry of good flavor, color and substance; the latter is of the old Excelsior type with all the good points of that old favorite, but with a better color and also otherwise are improved. Several are giving these berries trial and so far the reports coming in have been very commendatory of both sorts. Others are also undergoing trial and these many experiments will doubtless discover a better berry for us than any we now grow.

INJURY BY MELON APHIS.

The melon aphis first attracted notice through its injuries to cotton in 1854, and from that time on it has done more or less damage, year by year and, in view of its rapacity, rapid multiplication, and omnivorous habits, will no doubt continue injurious in spite of all that can be done to repress it.

As a melon and cucumber pest it was noticed in Florida and southern Illinois in 1880, and in the next three years caused considerable losses in those States and in Georgia. Soon afterwards it became recognized as a strawberry pest. In later years many other food plants were added to its known dietary. The years 1892, 1893, and 1898 were unusually bad "aphis years."

In 1893 information was received from a pickle company of Omaha, Neb., of severe injury in that State. This company was growing between 30,000 and 50,000 bushels of cucumbers a year, and several hundred neighboring farmers grew this vegetable for the company. Two-thirds of the crop grown in 1892 was destroyed by the aphis, and in 1893 half of the crop was lost These injuries made it difficult to induce outside planters to grow for the company.

In 1898 this species was extremely troublesome. In order that a good idea of its destructiveness may be had, some reports are cited. In January injury was reported on cucumbers in Florida and in May to strawberries in Delaware, where the insects were described as "taking everything clean." By June this insect had been very injurious to watermelons in southern Texas, when it destroyed many acres of early vines. In July, Texas correspondents reported the destruction of 1000 acres of cantaloupes in one locality, and the outbreak assumed such proportions as to cause much newspaper comment. One company reported that the ravages of this pest had cost them $20,000, and that agriculturists of that section had sustained irretrievable loss. In November a Pennsylvania correspondent reported losses to cucumbers grown under glass, and in December this aphis resumed its ravages to cucumbers in Florida.

TRANSPLANTING ONIONS.

Some idea may be had from the following as to the cost of transplanting onions. A one-tenth acre plat at the New Mexico Experimental Station, was trasplanted with onions grown in a cold-frame in 1902. The rows were practically 335 feet long by 15 inches apart with the onions four inches in the row, making 1005 onions to the row, or 10,050 to the plat.

The cost of transplanting this plat of onions amounted to $2.95. This included, besides the cost of transplanting, that of the first irrigation, bringing the onions from the seed-bed to the field, and dropping them ahead of the men transplanting, about the proper distance in the row.

At this rate, it would cost $29.50 to transplant an acre or 100,500 onions—practically one-fourth cheaper than to thin the same area. In 1903, a one fifth acre plat was transplanted on the 14th of March. The rows were 15 inches apart, and the onions four inches apart in the row. The cost of transplanting this plat was $6.00. At this rate, the estimated cost per acre would come to $30.

In the spring of 1904, another one-fifth acre plat was transplanted, the onions being set out the same distance as in the previous years. It cost $5.70 to transplant this plat. This would make one acre cost $28.50. The average estimated cost per acre for the three years amounts to $29.33.

Be what you wish others to become.

TOADSTOOLS AND MUSHROOMS.

There is no special class of mushrooms known to science as "toadstools." Toads do not sit upon these plants, nor do they eat them or have anything whatever to do with them. Country school teachers and others specially interested in country life would do well to collect and keep on exhibition authentically named specimens of all the more important edible and poisonous mushrooms of their neighborhoods.

SOW WESTERN SEEDS IN WESTERN SOIL

Here's a SPECIAL OFFER to make New Friends for LILLY'S Northern Grown Seeds

LILLY'S BEST Vegetable seeds are grown on and adapted to this coast. These 10 varieties are the aristocrats of the kitchen-garden. They represent the acme of Lilly effort, the result of years of careful seed selection and cultivation. This Special Offer gives you $1.50 in these seeds for $1.00. Read the descriptions, all of which are carefully and conservatively made. Living up to the catalogue description is what has built up the reputation of Lilly's Best Seeds.

PUGET SOUND SPECIAL TOMATO.

This miniature, from a photograph, gives you an idea how the tomato produces. Is an early dwarf, stands free from the ground, with hard, firm, round stalks. Yields large clusters of round, firm, luscious fruit, beautiful rich color, free from blemish, stands shipment splendidly. A three-season leader; popular everywhere. Perfected by us on our experiment grounds at Brighton Beach, and can be obtained solely from us. Sold only in sealed packets. Ounce, 60c; packet, 10c.

GOLDEN JERSEY WAX BEAN.

Brittle, tender, broad, thick—the best of all the yellow pod bush beans. Stringless. Beautiful golden color and delicious flavor. Vigorous, reliable, and an abundant producer. ½-lb., 25c; packet, 10c.

JACK FROST SWEET CORN.

Plump, milky kernels, that melt in your mouth; tender, sweet, prolific—really phenomenal. Dwarf variety, permitting close planting. Very hardy. Jack Frost seed has been perfected by ourselves on Puget Sound, is thoroughly acclimated and peculiarly adapted to Pacific Coast conditions. Not only season's earliest, but longest and latest producer. We cannot say too much in endorsement of this corn. Large packet, 15c.

LILLY'S GLORY CABBAGE.

Glorious in flavor, gloriously sound, a glorious grower and a glorious shipper. Lilly ships tons of this cabbage seed across the continent, as this variety, perfected on Puget Sound, is admitted to be the best cabbage grown. Even rounder and more solid than the Danish Ball Head, and infinitely better adapted to Pacific coast conditions. True to type, every head like its neighbor, symmetrical, white inside and solid to the core. ¼-lb., $1.25; 1-oz., 35c; packet, 10c.

PRIDE OF THE PACIFIC CUCUMBER.

Almost a seedless cucumber, the seeds being small and few. Perfectly smooth, very dark green, beautiful white flesh, perfect cucumber flavor, exceptionally firm, crisp and delicious. Grows 10 to 18 inches long, always straight, and dark green until ripe. Vine hardy and vigorous; enormously productive; yields early and late in season. ½-lb., 65c; 2-oz., 40c; oz., 25c; packet, 10c.

ENGLISH FORCING LETTUCE.

Large, crisp, tender; best variety for home culture, because easily grown outdoors or in frames; rich color, ideal for garnishing. Hotels gladly pay one-third more for this lettuce. Stands more neglect in watering, and does not quickly run to seed. Most profitable for market purposes because quickly ready in fine large bunches of beautiful light green, which never spot. ½-lb., 50c; oz., 20c; packet, 10c.

MT. RAINIER PEA.

Dark, rich green, well-filled pods, creamy and delicious; enormously productive. Propagated in Washington, and the best early pea ever offered to western growers. Especially valuable for market gardeners, commanding the highest prices through the season. Large packet, 10c.

CRIMSON GLOBE BEET.

Close grain flesh, very sweet, tender, blood red, delicately zoned with white. Exceedingly smooth surface. Finest in form, flavor and color. Free from woody, fibrous roots. Grows uniform in size—about three inches through. Matures early. Pkt., 10c.

GOLDEN HALF-LONG CARROT.

Best of all the yellow varieties. Very sweet, close in texture, golden yellow, solid, very smooth, attains large size, has small core, and adapted to all soils; under good cultivation yields 25 to 30 tons per acre. Ready for table at all times during growth. Equally valuable for stock. A market favorite. ½-lb., 25c; packet, 10c.

CRIMSON GIANT RADISH.

The larger it grows the solider it gets; twice the ordinary size. As hard as a bullet, while tender and deliciously crisp. Retains goodness long after maturity. ½-lb., 40c; packet, 10c..

SPECIAL PRICE OFFER.

$1.50 worth of above seeds for $1.00.

$1.00 worth of above seeds (one packet of each variety, with packet of Old Fashioned Flower Garden Seeds thrown in free) for 75c.

Six 10c packets, with Flower Garden packet, 50c.

Three 10c packets, 25c.

Above prices are postage paid.

Grow LILLY'S BEST SEEDS AND GROW RICH

Plant Lilly's Best Northern-Grown Seeds, grown on this coast for this coast, and be sure of profit. You will find that the saying, "Best for the West" is true in every case, and that Lilly's Best Seeds will give you best results. The above are only ten varieties of Lilly's Best vegetable seeds. For information as to the full line, write for

LILLY'S 1907 SEED CATALOG,

Which will be sent free, postpaid, on request. Lilly's 1907 catalog surpasses all previous books in attractiveness and completeness of plant information. It is thoroughly dependable, and besides containing descriptions, price lists and culture directions of thousands of varieties of seeds, bulbs, roots and cuttings, it is a handbook of information on poultry foods, poultry supplies, stock foods, fertilizers, garden supplies, sprays, horticultural supplies, etc. If you want one, free, mark an X in the white square.

HOW TO ORDER.

Mark an X in each white square opposite the variety of seed you wish to order, mark the quantity in square or on margin, figure up the total, clip out the ad., and remit in same envelope with the clipped ad. Be sure and write your name and address plainly, filling in the following blank:

Clip ad. and mail to

CHAS. H. LILLY CO.

Seattle, Wash.

Enclosed is $....., for which please send me $..... worth of Lilly's Best Vegetable Seeds, as marked above.

With the Citrus Growers

RIVERSIDE CITRUS GROWERS' INSTITUTE.

(Continued from page 99)

First. By interchanging experiences.

Second. By extending beneficial results of government investigations, state and national, and by rendering more efficient, organized aid in such work.

Third. By united effort in securing needed legislation.

Fourth. By organized effort in securing better transportation facilities.

The plan suggested briefly is as follows:

A central organization with affiliating associations in the various citrus sections, the present local clubs serving. The central association, with an executive committee and corresponding secretary to keep in touch with auxiliary societies.

The central association to meet annually.

A call was issued for a meeting of those interested in this line. A meeting was held at 4 o'clock, adjourned to meet at 1 o'clock on Thursday.

In the afternoon Frank L. Palmer of North Pomona had a very good paper on "Investigation Needed to Be Taken up by the Experiment Station." The paper embraced about everything in the line of citrus fruit growing, and was followed by one along quite similar lines by Prof. C. B. Sumner of Claremont.

Prof. Ralph E. Smith, director of the citrus experiment station, had a paper and spoke on "Proposed Experiment Station Work," and very fully outlined what he considered the proper work to be taken, which he classed under five heads, as follows: One.—Nature of soil and location. Two.—Kind of tree. Three.—Propagation. Four.—Orchard practice. Five.—Fruit handling.—Insect problems would be carried on for a time, but he thought that it would ultimately require a trained entomologist. The work of the station is already well started and several men engaged in it.

Prof. E. J. Wickson, Dean of the Agricultural College of the State University, was the next speaker on the same subject, but he claimed that Prof. Smith had covered all ground he had expected to occupy, but in answer to questions as to the maintenance of the experimental station, he said the $30,000 appropriated by the legislature two years ago had been sufficient for all purposes, buildings, etc., until the close of the fiscal year. This also embraced the laboratory at Whittier.

Prof. Wickson was also the first speaker of the evening, his subject being "Possibilities for Improvement of Citrus Fruits," and gave some very interesting reminiscences of the first citrus fair held in Riverside, when there were a score or more of somebody or others' best in oranges and lemons. That large list of the "best" had dwindled down to about five with two commercially supreme, namely the Washington navel and the Valencia. Of lemons there were three, with the Eureka in the lead. The demand was not now for new varieties, but for a greater adaptability of what we have, showing that it is not new varieties that are desired. They want a late navel, and a Valencia that will not turn green and that will have some navel qualities.

California has outstripped the world in orange production. Italy with its $6,000,000 worth of oranges a few years ago thought it had reached the limit, and Great Britain with a consumption of $10,000,000 of oranges and lemons was fully stocked, but here we have California producing $20,000,000 annually. This had been a triumph of selection. Experiments are being carried on by means of hybridation to give the orange a hardier stock so that it can be grown further north, but nothing in the line of injury to California was expected.

President Benj. Ide Wheeler of the State University gave a very scholarly address on education and on the relation of the State University to the experiment station, which was pronounced by many who heard him to be his ablest effort on an agricultural subject. He addressed his audience as fellow students. He said that the teaching of today in our university would have been ridiculed by the older universities a generation or two ago. Today the university fits people for trade and commerce, in fact educates them to fill all the various stations in life. Riverside was peculiar in that the people lived in the midst of their work—the city in the country and the country in the city. There never was anything just like it before. An education to be of value has to be part of the life. It is a something that promotes health. It is not anything that makes sickly. Health is the most contagious thing in the world. Education ministers to the highest religion by being a promoter of health.

Thursday, Jan. 24th.

No meeting was held Thursday forenoon, because of the great number who wished to take a drive throughout the city, its environs and to make a visit to the Citrus Experiment Station. In the afternoon, Mr. W. C. Barth of Corona, read a well-considered paper on some of the definite methods of fertilizing fruiting orchards successfully, now well determined in practice, and in this connection, Mr. Barth is a strenous advocate of the use of barnyard manure—"all you can get."

James Mills, Superintendent of the Arlington Heights Fruit Co., followed with a splendid talk, the embodiment of years of observation and practical experience. He asked the audience to look at the groves that were giving the best results in dollars and cents, and they would all find it was no haphazard hit or miss business, but the result of cool calculation. The fact that Mr. Mills has clearly demonstrated this truth in the successful upbuilding of his mammoth groves, caused his speech to be listened to with unusually close attention and he was enthusiastically applauded.

"What definite practical progress has been made in controlling orchard insect pests." This was the theme discussed by J. W. Jeffrey, horticultural commissioner of Los Angeles county. It is the largest subject before the institute, said Mr. Jeffrey, as it needs the cooperation of the officials and every orchardist in the state, and it was ably handled, in a way too, that plainly showed Mr. Jeffrey had made a deep and exhaustive study of the subject covering a considerable number of years.

R. P. Cundiff, chairman of the Riverside County Horticultural Commission, led the discussion of Mr. Jeffrey's paper. He called attention to the fact that old trees are more effected with red scale than are young ones. Quarantine has done more for Riverside than any other artificial means. No scale pest once introduced has ever been entirely eradicted. The speaker urged the necessity for a national quarantine law. S. A. Pease, Horticultural Commissioner from San Bernardino was called for and said that he had more faith in fumigation, one fumigation lasting for three years. Damage was general where spraying was used. Did not believe in daylight fumigation.

The committee appointed to report regarding the formation of a California Citrus Fruit Growers' Association advised the appointment of another committee of five, to complete the organization, and Mr. C. C. Teague, who was chairman of this meeting, appointed Messrs. Reed, Mills (Jas.), Koethen, Sumner and Bishop to arrange the preliminaries.

After the resolutions were read by Mr. C. E. Rumsey, and adopted, the most brilliant Farmers Institute ever held in California was brought to a close with a masterly address on "Reforestation and Water Supply," by Ex-Gov. Geo. C. Pardee.

Resolutions.

The following resolutions were unaminously adopted by the special Citrus Fruit Growers' Institute at Riverside:

Whereas, the importance of good roads to the California farmer is manifest in many ways heretofore not appreciated, and

Whereas, the necessity of a good road law is vital to the development

20 Reasons
WHY THE
Addison Pump

Is Better Than All Others

1. It will pump more water with less power.
2. It is more substantially constructed.
3. Has no overhanging bearings to spring and cause friction.
4. Absolutely uniform—does not break rods.
5. Plunger leather can be changed with less trouble and expense.
6. Water discharge in continuous stream—no pulsations.
7. Noiseless in operation.
8. Has no jar or hammer.
9. Perfectly balanced, no braces are required to keep pump in position.
10. Will be in good working order when other pumps with erratic or variable motion are in the scrap pile.
11. The frame contains within itself the main bearings, which are unusually large.
12. The cranks consist of three gearwheels, pinned on opposite sides, thus forming a double crank.
13. The outside gears are shrouded on the inside and the center gear on both sides. The pinions are placed on two counter-shafts in main frame in such a manner that the shrouds of the gears rest on the shrouds of the pinions, forming a bearing to carry the load when pumping, and thus keeping the teeth in proper mesh, giving the greatest strength and least wear and distributing the weight over six boxes.
14. The pitman rods are of the same length and are forged from one solid piece of best machine steel.
15. The driving and countershafts have only 22 inches between the bearings which carry the load, and with the size of shaft used makes it impossible to swing out of line, under the heaviest of work.
16. The cross-heads are planed and fitted with tempered brass strips made to fit groves in columns; so arranged that wear can be taken up.
17. Both pump rods are fastened to the cross-head pins, so there is no pulling strain on the cross-head proper.
18. By our specially constructed couplings, rods are as strong at joints as at any other part.
19. The Addison Patent Straight-Waterway Valves offer a free passage for water, causing less friction than in any other valve.
20. Pump can be operated without a stop as the following testimonial proves:

Addison Pump Co.,
Pomona, Cal.
Gentlemen:—

In reply to your inquiry of Dec. 24th., I am glad to say that your pump has now worked steadily for over two years with entire satisfaction.

As far as I can recall it has never had to be repaired, and has never missed a stroke.

Very truly,
J. H. McBRIDE.

Pasadena, Cal., Dec. 28, 1906.

If you will come to Pomona and spend a day with us we will show you our pump and other pumps in operation, then leave it to your own judgment to select the best.

We give an iron clad guarantee with every plant.

IT WILL PAY YOU TO INVESTIGATE THE ADDISON BEFORE PURCHASING A PUMP.

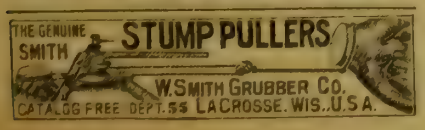
Electric Frost Alarm Thermometer

Automatically rings a bell to announce the approach of frost. Frost Prevention Co., Fresno, Cal.



of the state in order that it may compete with other states where climatic conditions are attracting homeseekers by reason of improved systems of road making:

Be it resolved: that the State Legislature now sitting be urged to enact a law which shall justly and equitably tax all property of the State to create and maintain serviceable highways.

Whereas, we deem Farmers' Institutes to be of the utmost importance in their educational benefit to all farmers, stock growers, poultry raisers and orchardists, we, the citizens of many southern counties, assembled in the Citrus Institute, do hereby

Resolve, that our representatives in the Legislature be urged to appropriate sufficient money to carry on Farmers' Institute so as to reach larger numbers of our agricultural people.

Resolved, that copies be furnished to the local papers, to the Secretary of the Board of Regents of the University of California, and to our representatives in the Legislature.

Resolved, that, Horticultural Commissioners should be appointed without regard to politics and to secure this they should hold a certificate from the State Board of Horticulture after the examination as to qualifications and their term of office be four years.

Resolved, that the interest shown by this gathering of citrus growers indicates an appreciation of the need for scientific research in this branch of horticulture, and a belief that the appropriation made by the Legislature for the Pathological Laboratory at Whittier and the Citrus Experiment Station at Riverside under the control of the State University is a fit recognition of a great industry, and we urge upon the Legislature an appropriation for the next two years that will provide for the Pathological Laboratory and Experiment Station in a manner to increase its usefulness—not less than $40,000.

Resolved, that the needs of the citrus industry were fully recognized by Governor Pardee and the sincere gratitude of all citrus growers is due him for the aid given in securing the first appropriation for this purpose, and for his hearty endorsement of the effort to bring science to the aid of every citrus grower in the State.

Resolved, that we deeply appreciate at this institute the presence of former Governor Pardee, of the President of the State University and of the Director of the College of Agriculture and his assistants, which indicates their sincere interest in our problems.

Resolved, that our sincere thanks is hereby given to those who have prepared papers and addresses on most important subjects.

Resolved, that a committee of three be appointed to confer with the Citrus League to ascertain whether that organization can be expanded to take in other great interests in this industry not now covered by their work.

Resolved, that this institute recognizes with sincere gratitude the long continued efforts of J. H. Reed of Riverside which have culminated in the successful inauguration of scientific work brought to the very doors of practical growers.

Resolved, that the thanks of this convention be extended to the Chamber of Commerce for the use of this hall, and especially to our friends who so kindly entertained us this morning in the ride over the most beautiful country on earth.

FERTILIZING IN FLORIDA.

The experience of most growers points to the use of chemical fertilizers alone for all citrus trees. The grove fruits more heavily, a better quality of fruit is obtained and the trees are certainly in a healthier condition. Where large amounts of organic fertilizers are used, dieback will almost surely affect the trees, and ammoniated fruit or fruit containing a large amount of rag and of poor shipping and keeping quality is the result. A pomelo, as already stated, is in quality a reflection of the food and cultivation given the tree on which it was borne.

Fertilizers should be applied at least twice a year, just before or at the time of the commencement of growth and again in summer, about the month of July. During the winter the roots of citrus trees in some parts of the State continue growth, and it would appear advisable in those parts to make a third application in the fall. If nitrate of soda be used as a source of nitrogen it is best to apply it in three separate dressings, in March, May and July, and the phosphatic and potash fertilizers twice, as recommended above. Nitrate of soda moves readily through the soil and may be lost to the tree unless appropriated in a comparatively short time after being placed in the soil.

The leaching of fertilizers is in a large measure prevented by the presence of humus, and pains should be taken to maintain a very considerable quantity of this material in the soil. It may be done either by mulching or by the growing of cover crops. Hume

---

The California orange season has opened in dead earnest and from now until May there may be a continual stream of yellow radiating across the continent. Yellow cars containing the golden yellow fruit and the yellow gold to pay for it all will come back to enrich the grower and shipper. It takes anywhere from seven to twenty days for the fruit to reach its destination, according to the distance to which it is billed.

If cars are available to support all demand, it is possible that shipments will run up to 250 cars daily, and this means that there may be upward of 3000 cars rolling eastward at the same time. If shippers are wise they will go slow about sending too great an amount of fruit out at this stage. Having been held up by the rains for so long a time, in addition to the unusual lateness of the fruit, it will be natural for all to want to get to the market first, and if everybody does ship it will surely cause a glut with the inevitable slump in prices.

The fruit is ready to ship, the color is superb, the cells are chock full of juice, and the sizes—well, the sizes are causing shippers sleepless nights; they are too large as it is, and the longer they stay on the tree the larger they will grow. Large sizes will be at a discount this year and a deduction will have to be made for this class of fruit from the quoted f. o. b. prices, which are for standard sizes. On the other hand, 200s to 288s will be at a premium, but the lesser sizes are few and far between. It does seem strange that while all of the fruit grown in Northern California this year was exceptionally small that the southern orange should be so exceptionally large.

Coming back to the necessity of shippers' using discretion in making their shipments in order to overcrowd the markets, there appears to be one contingency that will save them in spite of themselves and that is that it will probably be next to impossible to get cars enough to supply the demand for them. It is true that the railroads have had a respite, caused by the rains, and it is probable that they will have cars enough for all the fruit that ought to be shipped (about 100 cars a day for this month), but that the demand will be far in excess of this amount is a certainty.

While no doubt the roads are trying hard enough to get all of the refrigerators possible to California, they are facing unusual conditions. The roads all over the country are congested with traffic and they are grabbing everything available on wheels and while all agents have instructions to hurry the refrigators along, in most cases they are sending them loaded with anything from furniture to cattle. Motive power is also scarce and a prosperous country is actually suffering from too much prosperity.

A FREE CYCLOPEDIA.

The present day catalog, if up-to-date, may easily take the place of a cyclopedia, with the ordinary individual. We have before us a notable example in the 1907 catalog of hte Fancher Creek Nurseries. Aside from the beautifully colored plates of fruits on the cover, the book fairly teems with cuts of exceptional educational value.

As a prelude to every variety of fruit, is a carefully compiled and condensed set of rules governing the planting and culture which is of value to both the experienced planter and the "tenderfoot." In the ornamental department every plant is given its botanical name, its common name, its nativity, height, size and other distinguishing characters, so that no one possessing one has need of a horticultural cyclopedia. It is easily the finest catalog published on this coast.

IT'S PENNY WISE.

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 2124 Willow St., Los Angeles.

Piles Cured In 6 To 14 Days.
PAZO OINTMENT is guaranteed to cure any case of Itching, Blind, Bleeding or Protruding Piles in 6 to 14 days or money refunded. 50 cents.

TREES
True to Name

The demand for all sorts of fruit trees promises to be heavier than ever before. Place your order now, before our assortment is exhausted.

Deciduous Fruit Trees

We have this season a superior stock of

PEACHES PLUMS
PRUNES PEARS
APPLES APRICOTS
CHERRIES OLIVES
NECTARINES

All grown under our personal supervision in our Nursery Plant No. 3, which has a rich river bottom soil, permitting the most perfect roots.

Citrus Trees

All grown at our Citrus Nurseries in the Great Thermal Belt near Exeter.

Nut Trees

ALMONDS WALNUTS
PECANS

In all the leading varieties.

Grapes

On their own roots and grafted on Phylloxera resistant roots. All the leading Table, Wine and Raisin sorts.

Berry Plants

Burbank's Crimson Winter Rhubarb

Ornamental Trees and Shrubs

Roses, Palms, Greenhouse Plants

We are the sole propagators and disseminators of Burbank's four new and valuable creations. Write for illustrated pamphlet.

Calimyrna Figs

Our Great Specialty
None Genuine without our Seal

Also have a fine stock of
White Adriatic, Mission
and other standard sorts of Figs.

NEW CATALOGUE

Will be ready for distribution in January. It contains points about Pruning, Planting, is superbly illustrated. Will be mailed free.

Price list on application.

IRRIGATION IN CENTRAL CALIFORNIA, 97.

RIVERSIDE CITRUS GROWERS' INSTITUTE, 99.

DECIDUOUS FRUIT CULTURE—The Home Orchard; Winter Injured Trees, 100. Top Working Pecans; "Let Us Irrigate," 101.

LIVE STOCK AND DAIRY.—Digestion of the Cow; Homogenized Milk, 102. Citrons for Feed; Swelling Near Navel; Slobbers, 103. Scours; Bloat, 104.

THE VEGETABLE GARDEN.—New Strawberries Needed; Injury by Melon Aphis; Transplanting Onions; Mushrooms and Toadstools, 105.

WITH THE CITRUS GROWERS.—Continuation of Citrus Institute, 106. Fertilizing in Florida, 107.

EDITORIAL.—Riverside Citrus Institute; Return of G. Harold Powell, 108.

NEWS OF COUNTRY LIFE IN THE GOLDEN WEST.—Northern California Notes; Southern California Notes, 109.

PROFIT IN THE POULTRY YARD.—History of an Egg, 110. Pajaro Valey Poultry, 111. Why Ducks Don't Lay; How Many Turkeys to a Tom, 112.

THE ORNAMENTAL GARDEN.—Interpreting Nature; Almond History; Arbor Day Planting, 113.

CALIFORNIA HORTICULTURALLY.—Northern California Growing; Horticultural Inspectors; Plum Curcilio; Pear Blight; The Capital Grounds; Sutter County Ordinance, 114.

QUERIES AND REPLIES.—Soft Shelled Eggs; Bowel Trouble in Turkeys; Walnuts; Nitrate of Soda for Lettuce; Budding over Almonds, 115.

HOUSEHOLD DEPARTMENT.—Solitude (poem); A Detective Story; Why Passengers are Slaughtered, 116; Good Roads and Automobiles, 117.

THE PRODUCE MARKET.—Los Angeles Market; San Francisco Market, 118. Eastern Citrus Markets; Citrus Fruit Shipments Eastward, 119.

RIVERSIDE CITRUS INSTITUTE.

It is doubtful if a more successful convention of citrus growers was ever held in California, or one representing more talent in membership, or productive of more far reaching valuable results, than the one held at Riverside last week. It was emphatically a big convention of big brained men, who have advanced ideas, matured by experience of years in the cultivation of the citrus industry.

From the mass of ideas suggested and elucidated by the various speakers and essayists, some eminently practical observations were obtained. It would require a full number of the Cultivator, or even two numbers, to publish a consensus even of the opinions advanced by the various technical operators who gave their experience in orange culture. Naturally a business that reaches a volumne of $20,000,000 annually is big enough to draw to it the brainiest men in the state, and that is just what the citrus business has done in California. To listen to these Napoleons of success and study them as they outline their methods is interesting in the extreme. They differ from the agriculturists of the East in that they operate on purely scientific lines. They are students of soil in every feature it embraces. They look to scientific investigation and experience for continual increase in the quality of the fruit they produce, and are not content to abide by the results achieved in any series of former accomplishments. Here is the secret of success in the California citrus growers' operations. They come from investigation, from close observation of causes and effect and practical application of methods calculated to bring about highest results in cultivation fertilization, fumigation, irrigation, pruning and care of the fruit.

We are speaking now of the eminently successful grower who has mastered, so far as his light goes, the difficult proposition of orange culture.

Of course there are hundreds who do not study conditions. They are content to go along with mediocre prosperity. They have made money on their groves in the past and are apparently satisfied to let well enough alone. But the time is coming, very soon, when the indolent grower will be left in the race and perforce will have to be satisfied to receive less compensation from his orchard than his up-to-date competitor.

The public is being educated, in fact has been educated already, to demand only the very best in color, form and quality, which can be produced in orange and lemon culture. Hence, it behooves the grower, no matter how small his orchard may be, to devote time to investigation, to expend money to develop the highest character possible in his fruit. Land values are too high, now, to permit of carrying orchards which return only second-class products, which bring only second rate prices.

These points naturally followed all through the line of discussion indulged in by the speakers who were big enough to find a place either on the program or on the floor of the Riverside convention.

That the occupation of the citrus grower is one of the most delightful in the whole catagory of agricultural professions was evinced by the enthusiasm with which the members of the convention entered into the discussion.

It was almost impossible to single out any of a dozen or more of speakers, and say who of the number was the abler or more entertaining. One veteran grower, however, we believe he was Mr. Chapman, voiced the sentiment of the entire institute when he paid the orange and the orange industry of California this high tribute to its beauty and worth. He said:

"I wish that I had the language that would enable me to adequately set forth my high estimate of the orange and fascinating work of its culture, of the commercial importance, of the business, of its incomparable beauty and its wholesomeness as an article of diet. It is king of all fruits, standing without a peer, and not only contributes largely to the wealth of the state but also to the general health of the nation. It's delicious juices are as invigorating as they are palatable, toning up the organic function as well as the enervated nerve centers, thus giving to a man a tireless physique and a clear brain. Let us go forward in our calling, feeding the greatest nation in the world on a fruit that the poets would say 'was fit for the Gods.'"

The presence of Dr. Wheeler and Prof. Wickson of the State University and the admirable addresses they gave, were especially commended for the frankness with which they stated the plans outlined for experiment work as well as the subject matter of their addresses.

The Riverside Institute will go down in history of California University work, as one of the most fruitful of results of any institute ever held in the state.

MR. POWELL'S RETURN.

Citrus growers in Southern California will note with more than usual interest the return of Prof. Powell to that field. He expected to be back to Riverside about the middle of February, but the urgent demand for his services has hastened his return. At the Riverside Citrus Institute the statement was made that the investigation of Prof. Powell in the citrus orchards had saved the growers $68,000 the last season. Now his return is looked forward to with expectation that his researchers will still further increase the profits of the orchards.

His labors, however, have mostly been confined to methods of care in handling fruit and in its shipment, and it is in educating the shippers in this particular that he has proven so valuable to orange growers. It is to be hoped the department of agriculture at Washington, may permit Mr. Powell to remain a year in Southern California to continue his profitable work. After finishing his investigation in Southern California he ought to educate the citrus growers in the Porterville-Lindsay district along the same line.

Complete Irrigation Plants

A Stream of Water Four Feet Across and Nine Inches Deep, Pumped by a 60-H.P. Western Engine. The fuel is No. 2 Distillate, 5½ gallons per hour, costing 29 cents, making this plant without question the most economical in Southern California

Send us answers to the following questions, and we will furnish you preliminary estimate of the **cost of installation** and **cost of operation** of your plant.

1. Do you pump from bored well, river or ditch?
2. If from river or ditch give diagram showing elevation and character of soil.
3. If from bored wells state number and size of each and distance from centre to centre.
4. Have you a pit? Give size and depth.
5. How far from surface to water level?
6. Gallons per minute desired.
7. Has well been pumped? How much does the water lower?
8. Height above ground water is to be elevated.
9. Length of discharge pipe. State kind and size to be used.
10. What experience have you had with power?
11. Have you decided on pump; if so what make?
12. What part of the plant do you want us to contract for?
13. When do you want plant installed?
14. Do you want us to install plant? If not, who?

We Guarantee the Cost of Operation

News of Country Life in the Golden West

Northern California

AGRICULTURE.

Watsonville has been visited by about 22 inches of rain this season.

Arkelian Bros. of Fresno, will grow 160 acres of cantaloupes near Exeter.

In many districts the rains have seriously interfered with plowing and seeding.

The Grange at Sunnyvale is planning a Farmer's Institute to be held on February 22.

Tulare cheese will soon be on the market, not only made in Tulare but labeled "Tulare."

Farmer's Institute will be held at Panama Feb. 12—13, and at Bakersfield on the 14th.

Los Gatos has had a rainfall of 13 inches so far this year, as compared with 4.17 of the same time last year.

Two lots of hops were sold in Ukiah last week; Pickle and Adams of Potter Valley had 170 bales and Bartlett Bros. 128 bales, the price being 12½ cents.

Hollister Creamery is turning out about 200 pounds of first-class butter daily. This week it reached the highest notch in the market selling like hot cakes for 37½c per pound.

The Tahoe Stock Association, which was organized in Folsom by the stock raisers of Sacramento, Placer and El Dorado counties, will hold its second meeting next Monday in Folsom.

E. E. Chubb of Escondido, has finished marketing his sweet potato crop and reports that off of one and one-half acres of land he grew ten tons of sweet potatoes, which netted him $400.

Someone has said that buying a dairy cow is like courting a girl, you must know something about the mother. We cannot expect good results from a heifer when her ancestry was a failure.

Pajaro Valley farmers who have beets on adobe land will be unable to haul them for some time to come. The ground is so wet and muddy that to get into it at present with teams would be out of the question.

Tiling for drainage has proved a great success about lowlands of Chino. Six to eight inch tile is used, in one-foot lenghts, and it costs about $10 an acre. Seventy-five per cent. is esteemed a conservative estimate of the value to the land.

H. E. Williamson of Moneta, has 3 heifers which gave in December 2868 pounds of milk, which tested 4.35 for butter fat, giving a cash return of $51.94, added to which is all the milk used in the family which in this case was considerable.

So far this season virtually no planting has been done by the farmers of Shasta county. The continual rain and snow storms have so saturated the ground with water that nothing but mud could be turned over by the moldboard of a plow.

The meetings under the auspices of the Sacramento Chamber of Commerce and direction of Prof. C. W. Woodworth, in which short courses in agriculture were to have been given, have been canceled on account of the lack of attendance and proper interest.

HORTICULTURE.

Orchardists all over the north complain of too much rain.

Eucalyptus will be planted in all parts of Central California. this spring.

No more rain is needed to insure abundant fruit crops, if soil moisture alone is all that is needed.

Fruit trees in all parts of the State, and this applies especially to citrus fruits, have felt no ill effects from either snow or cold weather.

In the great valleys of Central California the heavy rains have drowned out all orchard pests and gophered trees will be a rarity for a time.

H. V. Calkins of Linusay is preparing the forty acres he recently purchased at Santos, to plant this season, 20 to oranges and 20 to Emperor grapes.

The Lamoine Lumber and Trading Company has paid $300,000 for 10,000 acres of lumber land in Shasta and Siskiyou counties and the deed was filed for record in Siskiyou county.

Oranges shipped from Folsom to Eastern markets have been bringing some top-notch prices during the past couple of weeks, and the results of the sales have been very encouraging to the growers.

A large amount of orchard pruning is being done in Pajaro Valley at the present time. That work has been greatly delayed by the heavy rainstorm and fruit growers are putting on extra large forces and rushing the work.

A large percentage of the orchardists of Pajaro Valley are ready and anxious to commence spraying their fruit trees with the lime-sulphur solution just as soon as the ground dries out sufficiently to permit the hauling of a spraying outfit through the orchards.

Secretary A. E. Miot of the Tulare county Board of Trade is having prepared a special orange bulletin descriptive of the citrus belt. The first page will contain a large half-tone of the Williams orange ranch near Porterville.

A carload of Orangevale navels sold in Chicago, brought the handsome average price of $3.25 per box. Three cars in Boston brought averages of $3.10, $2.87½ and $2.85, while in Chicago an average of $2.50 was received, and in New York an average of $2.42½.

Articles of incorporation have been filed at Fresno, by the Eucalyptus Forestry Company, formed for the purpose of growing eucalyptus trees and all other kinds of trees and shrubs and for extracting such by-products as eucalyptus oil from the trees.

Southern California

AGRICULTURE.

San Jacinto is building another creamery.

Pomona has had 17.80 inches of rain to date.

The rainfall at Santa Maria to date has been 12.53 inches.

The rainfall for the season at Lancaster has reahced 12.17.

The rainfall at Ventura up to the present date has been 18.26 inches.

Rainfall to date at Chino, 17.18 inches, last season to the same time, 5.17.

The La Habra Farmer's Club held an enthusiastic meeting last week at the Launer ranch.

The rainfall for the last storm at Corona, amounted to .95 of an inch! for the season, 11.95.

The Arrowhead tannery recently injured by fire at San Bernardino, will be immediately rebuilt.

Thousands of trees for shade, windbreak, and ornamental purposes are now being planted in the Imperial Valley.

Grain ranchers in the south are doing some vigorous kicking, because the continuous rains have prevented seeding.

The Chino Land company shipped 400 fat steers—about twenty cars—to the Cudahy Packing Company, Los Angeles, this week.

The Orange County Farmer's Club met last Saturday at C. F. Bennett's out on Tustin ave and a very lively and interesting time was had.

The latest news from the headworks on the desert seem to show that the flow of the Colorado River into the Salton sink will soon be again under control.

The prospect now is that the Chino farmers will plant 10,000 acres to sugar beets this year, which is, we believe, the largest acreage yet put in at Chino.

The consensus of opinion among all the old residents in Ventura county is that there never was so much rain at any one time as there has been during the past season.

Extensive planting of cantaloupes will begin within two weeks in various parts of the Imperial Valley, and the acreage this season will be much greater than last season.

Horticultural Commissioner Nebelung for the Anaheim district reports that 59,770 trees have been fumigated and 20,000 sprayed in that section of the country during the past year.

For several days a well close to the junction of the S. P. with the Santa Fé loop line at San Bernardino has been flowing, it having been dry for nearly fifteen years. It is sending forth a good-sized stream of water.

A few months ago Mr. W. A. Van Horn secured the services of a first-class Swiss cheese maker and started an industry at his ranch, five miles south of El Centro, that at the present time promises to increase very rapidly.

At least one artesian well west of Claremont has resumed flowing after an interval of about thirteen years. Water is rising in the wells lower down in the valley, and the increase will continue now for a long time to come.

On the ranch of J. E. Jenison, just east of Downey, on January 17, was born a freak calf, perfect and well formed in al particulars and having two well-formed and distinct heads. They were joined just back of the ears and each one worked independent of the other.

HORTICULTURE.

J. H. and F. M. Reed of Riverside are erecting a lemon packing-house.

F. A. Fetley of Riverside is planting 180 of oranges in Tulare county.

A company has been formed to put in a hundred acres of Malaga grapes near Thermal.

A sorting table put into the Jameson packing-house at Corona will double the capacity.

Newport Beach expects to have a fruit cannery erected there in time to handle next summer's crop.

The shipments from Corona since last issue are as follows: Oranges, 16 cars; lemons, 8 cars, making 43.

Arkelian Bros., grape growers and shippers, have bought 320 acres of land near Mesquite Lake on the desert.

G. Harold Powell will reach California on the last day of the present month to resume his citrus fruit shipping investigations.

A company has been formed at San Bernardino for the purpose of planting thousands of acres of vines and engaging in the production of wine.

The Sunset packing-house at Corona has doubled its capacity of handling fruit by the installation of new brushers, elevators, automatic weighers and sorting machines.

January is a critical month with the orange market. Generally there is something of a slump if there be cold weather in the big cities. This year, while the trade is a little dull, fair prices have maintained up to this writing.

The Santa Fé Railroad Company has consented to the improvement of the station grounds at Arlington. Between a hundred and two hundred trees will be planted there by Mr. J. H. Reed and the company will pay the bills.

A prominent orange shipper says that the shipment of fruit up to date is nearly 2000 carloads short of what it was at this time last season. This is owing to the unfavorable conditions which prevailed the past month; and not on account of lack of fruit.

C. W. Leffingwell, Jr., of Whittier is setting out 10,000 walnut and citrus trees on his large ranch; 500 acres will be set out in full this spring on the recently acquired acreage and considerable improvement in buildings, water works, etc., will also be made.

The Mutual Orange Distributors of Redlands held a meeting at which representatives were present from each of the houses in the association and from the reports made by all it was shown that the plan on which the distributors are working is proving very satisfactory, in fact, better than had been anticipated.

LINERS

Liner Advertising
Advertisements in Liner Column 1½ cents per word. Eight words to a line. No advertisement taken for less than 25 cents.

REAL ESTATE.

CASH FOR YOUR RANCH—SEND FULL description. Will sell if price is right. W. A. COLWELL. 223 West 2d., Room 101. Los Angeles.

TREES.

FOR SALE—GRAFTED WALNUTS, PLACentia perfection on wild roots, 2 to 12 feet high, one year old and some two years old. For further particulars address ADOLPH RIMPAU, Anaheim, Cal.

WASHINGTONIA FILIFERA AND ROBUSTA and Euretia edulis palms, from 5 to 10 feet high, to exchange for other kinds of nursery stock or sold for cash. Give offers. Enough for carload lots. Erickson & Heinz, Brawley, Cal.

BERRIES.

DEWBERRY PLANTS—"SELECTED GARden," will produce big crop in 15 months, most profitable berry in California. Plants $10 per thousand. Special prices in large quantities. 1000 Pepper Trees, 4 to 6 feet. 1000 2-year-old Date Palms, 50,000 Lippia Repens to plant lawns, hillsides and terraces. GEO. B. SOUTHARD, Redlands, Cal.

CHOICE PHENOMENAL BERRY PLANTS—grown from tips only, the most prolific berry known. 75c per dozen net, $1.00 per dozen by mail. $5.00 per hundred. C. NELSON, Moneta, Cal.

HIMALAYA BERRY PLANTS—2 FOR 25c. $1.00 per doz. $6.00 per hundred. Express prepaid. BASSETT'S FLORAL GARDEN, Loomis, Cal.

FOR SALE—FIVE THOUSAND MAMMOTH Dewberry Plants will produce 600 crates to the acre. Write for prices to Oak View Berry Farm, Gridley, Cal.

FOR SALE—BURBANK'S PHENOMENAL Berry Plants, true to name, in quantities to suit. For terms apply to E. Thompson, Box 630, Fresno, Cal.

HIMALAYA BLACKBERRY, $1 PER DOZ., $6 per 100: Mammoth Blackberry, Loganberry and Lucretia Dewberry, 50c per dozen, $3 per 100.
Adelbert Cooley, R. D. 2, Laton, Cal.

COFFEE.

SPARR'S JAPARA COFFEE—YOU AND YOUR friends are offered an opportunity to buy the finest drinking coffee grown, price 25 cents per lb., packed in 5-lb. cans, one dozen in case, 60 lbs., freight prepaid. This is about two-thirds of the usual price charged for ordinary coffee. Send $2.80 for 10-lb. can. Liberal sample sent by mail on receipt of 4 cents postage. F. W. Sparr, 114 East Market St., Los Angeles, Cal.

LOVERS OF GOOD COFFEE—YOUR ATTENtion is respectfully called to the above advertisement. If you enjoy a cup of really good coffee you can buy it from me almost as close as you can buy sugar. Make up an order with your neighbor and write to me. I am a direct importer of Tea and Coffee and can save you money. I ship to all parts of the Pacific Coast and guarantee every pound fresh and pure. Established in Los Angeles ten years. F. W. Sparr, 114 E. Market St., Los Angeles.

POULTRY.

ORPINGTONS AND REDS; PEKIN DUCKS—13 prizes on 16 entries also silver cup at "Breeder's Show" 1907. Eggs now ready, can't help but hatch winners, we breed them that way, fifteen years' experience counts. Our stock are great layers, rapid growers, top market quality, we guarantee satisfaction. GOODACRE BROS., Box 45, Compton, Cal.

BLUE ANDALUSIANS—I did not exhibit this year but have better stock than ever. A few nice trios for $5.00, also good breeding cockerels for $2 and $3 each. Must have the room they occupy. Eggs for hatching $2 and $2.50 per 14. No fear of inbreeding as we have three strains.

BLUE ANDALUSIANS— THOROUGHBRED stock, good laying strain. Eggs $1.00 per 14, $5.00 per hundred. OAKDALE RANCH, Fallbrook, Cal.

PARTRIDGE WYANDOTTES—C. ANDREWS, 332 West 3rd street. Yards, Hollywood. 11 prizes and silver cup at show 1907.

COLUMBIAN WYANDOTTES, THE FANCY and Utility Fowl. Eggs and stock for sale. Eggs from Pen No. 1, headed by First Prize Cock at late Los Angeles show, $5 for 13; No. 2, $3. Also Black Tailed Japanese Bantams, $4 per 13. Frank J. Ironmonger, Hollywood, Cal.

FOR SALE—WHITE WYANDOTTES, SILVER Cup Winners at late show. Choice Stock for sale. Eggs, $2 per setting, $10 per 100. Mrs. Mary Van Brunt, Avery and Benefit Sts., Hollywood, Cal.

FOR SALE—FINE, LARGE, VIGOROUS White Plymouth Rock cockerels, $3, $4, $5 and $10 each. FRANK H. THOMAS, 1820 Hobart Blvd. Los Angeles.

SINGLE-COMB WHITE LEGHORNS, FINE white, large, birds; good layers. Hatching and shipping chicks, Eggs for hatching; call and see, or write for particulars to MRS. D. F. STONER, Ontario, Cal.

FOR SALE—PURE BRED STOCK, S. C. White Leghorn Eggs. Large eggs, great layers, eggs for hatching only. $1.50 per 15. $6.00 per hundred. RICHARD POWERS. Anaheim. Cal.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for greatest batch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be isued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. FILCHER, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

HISTORY OF AN EGG.

SEVERAL of my correspondents have recently asked me what they can feed to make good hard egg shells, for their hens are laying soft-shelled eggs, or eggs with a thin shell, or "leather shell" as some call it.

Soft-shelled eggs are usually caused by wrong feeding. It is due either to a lack of shell material or to inflamation of the shell forming chamber of the ovi-duct, which no longer secretes calcareous matter. It is also said that fright may cause the premature expulsion of an egg before the shell has been formed. Over-stimulation by the use of spice or so-called egg foods, tends to the production of thin shelled eggs. Worms may increase in the intestines to such an extent as to stimulate the egg passage to push along the egg beyond its usual distance. An over-fat hen has a tendency towards laying thin shelled eggs; in fact, this is the usual case of soft shelled eggs. Another cause is the lack of grit, as well as the lack of lime.

How an Egg is Produced.

Anyone upon opening after death, the body of a hen, will find a cluster of eggs in formation, much like a bunch of grapes. This is what is called the ovaries. These however are but rudimentary eggs—says poultry and pet stock,—frequently there are as many as 70 in a bunch, varying in size from a pins head to the size of a pigeon's egg. Each of these eggs is contained within a thin transparent sack, the ovaries, and during the laying period of the hen. These eggs are maturing, thus keeping up the supply. These rudimentary eggs have neither shell or white, consisting wholly of yolk, and as they become larger and larger, they arive at a certain stage, when by their own volition, weight or other cause, they become individually detached from the bunch, and fall into a sort of funnel, leading into a pipe or passage way, called the oviduct,—this organ in the hen is from 22 to 26 inches long. During the passage of the egg through the oviduct to the outer-world, it becomes coated with successive layers of albumen—the white—which is secreted from the blood vessels of the oviduct in the form of a thick,glary fluid, and is prevented from mixing with the yolk by the membrane or sack which surrounded it before it became detached from the cluster. It is also strengthened by a second and stronger membrane formed around the first, immediately after falling into the funnel, and having what is like two twisted cords, of a more dense albuminous, called by anatomists chalazes. These pass throught the white at the ends and are, as it were, embedded therein, thus preventing the yolk and germ from rolling about when the egg is moved, and serving to keep the germ uppermost, so that it may best receive the heat imparted during incubation.

Formation of Shell.

It is during the passage of the egg through the lower part of the oviduct that it gets covered with two skins that are found inside the shell. These although lying close around the egg, at the thick end become separate, and from what is called the air bubble or chamber. This speck or air space becomes daily larger as the egg gets older, and is frequently equal to one-fourth of the entire egg. This air-chamber, if perforated with the finest needle, will prevent the egg hatching. When the egg has advanced more than half-way down the oviduct, it is still destitute of shell, which begins to be formed by a process of secretion, and when about completed, various shades of brown and tinted coloring matter, are imparted in those breeds to which colored eggs are peculiar; sometimes in very brown eggs, white spots appear, but these can be readily rubbed off. When the shell and coloring are complete, the egg continues to advance along the oviduct till the hen goes to the nest and lays it.

Egg Production.

Eggs are produced from the surplus food, which is that over and above what is required for the sustinance of the hen, and if this is to stimulating, or given in excessive quantities, the result is that in the former case the ova are produced so rapidly that sometimes two of them drop into the oviduct together, which results in the eccentricities which frequently puzzle the poultry keeper. The ova travel along together down the passage and receive the white separately, but become enveloped in one shell, and when laid, are what is commonly known as double yolked eggs, but more properly it is a double egg, the white being duplicated as well as the yolk. Should these yolks be fertilized and the egg hatch, we get the occasional four-legged or other chicken monstrosities. A further result of stimulating food is varied from the above when the ova mature in excess of one day. In place of falling into the passage in pairs as above, the two drop separately, but on the same day. This results in soft egg shells, not from want of shell forming material, but rather because the shells cannot be formed as fast as the mature egg is ready for the covering. Crooked eggs are no uncommon thing in the poultry yard, and are attributable as follows:—

Twenty-four hours are usually sufficient for the formation of a perfect shell, but when, by stimulation, a second egg falls close on its predescessor, reaching it before laying, the second egg, which is up to this time soft, and is laying against a hard one, becomes covered with the shell, it when laid, presents a flat or crooked side, as the result of its position against the hard one.

Over Feeding.

To over-feeding is also attributable the further irregularity of one perfect egg being formed within another. This is caused by the irritation of the oviduct, which, contracting in front of the perfectly formed egg instead of behind it, forces it back until it meets another yolk, when the two join and again become coated with the white and the shell, thus producing another wonder. Sometimes when the ova are nearly exhausted by continuous laying, the albumen secreting organs may be most active, which results in small marble-sized, but perfect looking eggs, which are merely a shell covering a portion of albumen. Such eggs when laid, have the peculiarity of never having been at any stage attached to the ovary, but are a product only of the oviduct.

The egg normally remains in the shell forming a portion of the oviduct from seven to twenty hours, but it may become lodged at this point and be held there for an idefinite time. As the temperature of the bird's body is that most suitable for incubation, it is plain that a fertile egg arrested in the oviduct must soon undergo important changes. For this reason, some eggs have the odor and taste of stale eggs, although they are newly laid. To have good egg shell, give the fowls plenty of shell forming material, such as wheat, bran, crushed egg shell, cut or calcined bone, broken mortar, crushed oyster-shells, etc. Give green food and avoid causes of inflamation of the oviduct.

OUR ENVIOUS OUTSIDERS.

There is crying need in Los Angeles right now, today, for more quarters for tourists.—[Los Angeles Herald.

That's what! Has anybody ever seen even the most able-bodied tourist get away from a California resort with a quarter?—Louisville Courier-Journal.

PAJARO VALLEY POULTRY.

The poultry industry in the Pajaro Valley is just in its infancy and before many years Watsonville will rival Petaluma as a poultry center. Our soil and climate are peculiarly adapted to poultry raising. Watsonville being adjacent to the main line of the Southern Pacific Railroad and having connections by water to San Francisco and other coast ports, makes it an ideal shipping point.

The Salsipuedes Egg Ranch is situated one and a half miles east of Watsonville, on the Salsipuedes road. Salsipuedes is a Spanish word meaning "get out if you can," and was the name given by the Mexicans in early days to a small stream running through the valley. The land is a part of the old Salsipuedes Rancho, a Spanish grant which extended along the Pajaro river. There are 120 acres in the ranch, 80 acres being in alfalfa and 40 acres in apples, a dairy of 30 cows, and, consequently, always an abundant supply of warm fresh milk for poultry.

The most important feature of the business is getting started right. This means a good laying strain of fowls, or else procuring eggs for hatching from some reliable breeder. The latter plan is best as it gives the novice an opportunity to work up with the business. Under this plan one must be prepared for hatching, brooding, etc.

Care must be exercised in the selecting of an incubator. There are a number of good machines made on this coast. I use a hot water machine, the water circulating in pipes through the egg chamber. Great care must be employed in incubating; but by following the rules laid down by the manufacturer of the machine you are using, any one with ordinary intelligence will be able to secure a fine hatch, if care has been exercised in the selection of fertile eggs.

When the hatch is over allow the chicks to remain in the incubator for twenty-four hours and then transfer them to brooding houses, which is divided into pens of 50 capacity each. Each pen could accommodate a few more chicks, but experience has taught that is does not pay to crowd too many chicks together. I use two hot water brooders, which are divided into four sections. Each division of the brooder has an opening into each pen for the chicks to go back and forth. Just outside of the brooder house the pens are all extended. When the chicks are about a week or ten days old they are allowed to run outside, if the weather permits. One must be prepared for a shower of rain and not allow the young chicks to become wet and cold, as this would result disastrously to your flock.

My chicks are fed for the first time about forty-eight hours after hatching. Their diet consists of warm fresh skimmed milk, with a liberal allowance of chick food. There are many good brands of chick food on the market which contain all the elements necessary for the development of the chicks. Chicks are transferred from the brooder to larger quarters when they are about six weeks to two months old, according to breed and condition of the weather. Here they are allowed free range to alfalfa. With a little grain added, the pullets soon come to maturity. I have found by expericnce that the best time to get rid of the cockerels is when they begin to crow, except what is needed for breeding purposes. At the present high prices of feed, there is nothing made in growing broilers for profit.

When pullets are about six months old transfer them to pens provided for that purpose. They will do better than on free range, if they are given proper care. Mine are fed each morning mash food, consisting of bran shorts and a little rolled barley, the whole being moistened with warm skimmed milk. About ten o'clock they are given a feed of green alfalfa or kale. At night they are fed corn in the ear, which gives them excercise in getting it from the cob. An occasional feed of oats or wheat in a litter is good for a change, and also gives the hens something to do. About once a week aim to give the flock a liberal supply of fresh green bone, which may be obtained at the local butcher shop.

The size of my pens are 25x75 feet and are enclosed with 5 foot 2 inch wire netting, and are located in the or-

RANDALL & ROBBINS, BOX 412, SANTA ANA, CAL.

chard. Poultry and fruit trees go well together. Fresh water, an absolute necessity, is piped to each pen. Each pen is supplied with gravel, charcoal and ground shells. My chickhouses are 10x16 and are divided in the center by a wire partition. This serves for two separate houses, and by bringing the dividing fence between the two pens on a line with the division of the chicken houses, access can be had to each pen from the separate divisions. The floor of the chicken houses is raised two feet from the ground, which gives the chickens a scratching shed to dust in. The roosts are made of 2x2 surfaced redwood and are suspended from the roof by heavy wire, about a foot from the floor. The ends of the wire are bent square to hold the 2x2 strips, which can be removed when desired. Nests are made on the outside of the ends of the chicken houses by providing a frame the full width of the building and about two feet wide. On this platform are placed orange boxes which serve as nests. A covering is made with a slanting roof, which darkens the nests and keeps out the rain. Many breeders use trap nests, which are beneficial in determining the layers and non-layers. It takes much time and patience to successfully use trap nests, but it is a practical method of finding out the laying qualities of your flock.—C. S. Redman, Watsonville.

WHY DUCKS DON'T LAY.

"Why don't my ducks lay?" is a query one often sees in the poultry papers, and the answer is usually:

"Something wrong with the feed." It never seems to be admitted that something may be wrong with the ducks.

In November a few of my ducks were laying. By confining each duck in a separate pen for one or two days I selected the layers from the flock.

These layers, seven in number, were given a pen by themselves and since then have averaged six eggs per day. As a winter record, this is very good. But I have more than 100 others, some of them young birds six and seven months old, that during this time have not layed an egg. Why this difference? Was it the feed, All were fed out of the same sack.

The explanation seems to be that some ducks are naturally good layers, while others are not. The ducks I bought to start my flock were, unfortunately, mostly of the "other" kind. Hence, while I have a few good layers, the majority of my flock are not worth their keep.

Three or four years ago the Indian Runner duck was hailed as the coming egg-producing bird for Southern California. The good old hen was to be put out of business. But where many people have tried ducks, few have found them satisfactory, and the hen seems to be in no danger of losing her prestige.

A short time ago I saw a man selling a number of nice looking ducks to a poultry dealer. "What's the matter?" I asked, "Don't the ducks lay?" "Naw," he replied, "These Indian Runners are not the great layers they are claimed to be.' There are many others whose experience is the same.

Ducks are tremendous eaters of high-priced feed, and a bird that will lay only during the spring season will yield no profit. Some ducks will lay 200 eggs per year, but many will not, and no amount or kind of feed will change a naturally poor layer into a good one.

Hereafter I will test my ducks and breed only from the best layers. In this way I hope to build up a profitable flock.—E. V. W., Orange.

No rules can be formulated for feeding all kinds of fowls, as each flock differs from others. The poultryman must determine for himself which of his hens require special foods, as breeds, egg production, ages and other conditions must be considered. Do not overlook the fact that each hen is an individual and that she has her likes and dislikes, being profitable or productive according to surroundings and circumstances.

Superstition alone preserves the largest grove extant of Lebanon cedars—400 trees.

INTERPRETATING NATURE.

HOW OFTEN DO WE SEE PEOple who are able to fully understand Nature in some of her various departments. These are people who first of all have a deep grounded love for all nature, yet may intuitively lean toward some certain manifestation or mood which possesses such strange, yet strong attraction for certain individuals.

The landscape gardner, if he be born to the calling, and all too few are, should rely absolutely upon Nature to set him right when perplexed with any problem other than roads, paths and those necessary details with which man mars the beauty of the earth's reposeful surface.

All desirable landscape effects, in meadow, plant groups, shrub massing, tree groves, rockeries, water views and effects—all may be found somewhere in nature—a solution to every problem to him that hath eyes to see.

In the same way is the love for animate nature manifested, though in all these cases two factors enter—the love is reciprocal. How often do we see men or women on the farm whom the animals will follow while others repel them. Enter into conversation with such an one and he will tell you, "I just love horses," or "I was always very fond of cattle;" and so might it be traced through all departments of nature, but that is far from the object of this article.

To return to the subject proper, in your garden "work out your own salvation." Do not blindly follow the lead of any. Study nature and you will soon learn to read her aright. Note how she shields the ferns from sunsight, how give them the necessary supply of water, how well drained and what the composition and texture of the soil. Then go home and duplicate, as nearly as possible, these natural conditions, and success will attend your efforts. In the same way must you note conditions necessary to shrub and tree life and after a short time spent in such observations, the purpose and intent of nature will be revealed to you and all be made plain which had hitherto been a sealed book. Nature holds no secrets in these lines. Our lack of success with plant life is due to partial or total blindness. Though we have eyes, we see not.

THE ALMOND.

The hopes of a future happier hour
That alights on misery's brow,
Springs out of the silvery Almond flower
That blooms on a leafless bough.
—MOORE.

The ancestors of the Almond were well known as far back as in the days of the Patriarchs. This fruit formed part of the offering with which his brethren sought to propitiate the unrecognized Joseph, when their father bade them carry down the man a present. It afforded a model for one of the earliest works of art, for the bowls of the golden candlestick in the tabernacle were fashioned after its form, and a branch of the tree had the honor of being the subject of a miracle, when Aaron's dry and sapless sticks were made to blossom and to bear.

The Romans do not appear to have been very intimate with the fruit, Cato only mentioning them as "Greek nuts," and some believe that even this supposed allusion refers rather to walnuts.

The almond tree is indigenous to Barbary, where it grows so abundantly that its delicate fruit is not even reserved exclusively for the human palate, the Moors, it is said, being accustomed to drive their goats under the trees as they gather it, when the animal carefully nibbles off the skin as it falls and then greedily feed. In that, its native land, it furnishes the first fruits of the year, the blossoms appearing in January and the nuts being matured by April. Its generic name, Amygdalus, is derived from a Hebrew word signifying vigilance, because its blossoms announce the coming of spring, preceding even its own leaves, a fact which the fanciful Greeks invented a myth to account for.

"Phillis, the beautiful Queen of Thrace," so runs the tale, "had not long been the bride of Demophoon, son of Theseus, who had been cast upon her shores when returning from the siege of Troy, and whom she had kindly received and at last married, when the newly wedded husband, hearing of the death of his father at Athens, left her to proceed thither, promising, however, to return in a month. Happening to be detained beyond this time, his disconsolate wife wandered daily by the sea to watch for his return, braving even the coldest blasts of winter, until at length grief and exposures so wrought upon her that she one day fell dead upon the shore, when the pitying gods, admiring her constancy, saved her form from corruption by changing her into an almond tree. Not long after Demophoon at last arrived, and overcome with grief on hearing the mournful fate of his lately blooming bride, rushed widely to the lifeless looking tree and clasped it in his arms. The soul of his Phillis, changed as was her form, responded to him still, and quicked by his warm embrace, the tree burst forth into a joyous flush of blossoms, though even the time of leafing had not yet arrived.' '

ARBOR DAY PLANTING.

The educational results of Arbor Day endeavors, have been extensive and beneficial. Even though the celebrations have been largely exhibitions of sentiment and the planting almost wholly unsuccessful, yet pupils, teachers, and parents have learned much about trees as useful, living things, and about forests as great sources of national wealth to be protected and perpetually maintained. The smallness of the results has itself drawn attention to the inadequacy of past methods. It is due in part to lessons learned in Arbor Day planting that we are now ready to begin work with a better understanding of what is to be done.

The need of the school-grounds is for plantations of trees, cared for by such methods as will keep them constantly thrifty. The trees should be selected and planted in the most careful manner. They should be properly placed, and in sufficient number. To plant in this way requires a great deal of attention to details. It may be the work of several days. The perishable nature of trees also makes it extremely important to plant them when the weather conditions are just right. Dry, windy weather may cause several days' delay in the planting. It is therefore impracticable to depend wholly on a specified day for the work Let the trees be planted at the right time; then, if public exercises are planned, they may be held on an appointed day after the planting is completed.

Many difficulties at present encountered may be overcome by placing the direction of the planting in the hands of some person who understands fully its purposes. The pupils should assist in the work because it is for their own school ground, but on account of their lack of experience they should work under competent supervision.

As might have been expected, the results upon the school grounds have not been marked. Too often the work has been impulsive and the interest transient. Trees planted with ceremonious dignity in April have died of neglect before September, and those that survived have been left to fight unaided their battles for existence. So little attention has been paid to the choice of trees and to the methods of planting that those entirely unfit for the situation have often been used, and have been planted in places where they could not receive protection while young, or serve any useful purpose when grown.

"Well, doctor, what do you recommend?"

"I think you need mud baths."

"Mud baths? Great heavens, man, I've just come through a bitter political campaign!"

It is never too late to be what you might have been.

No matter how good your lamp, a MACBETH chimney makes it better.

They are made to fit, and do not break from heat.

My lamp-chimneys offer the only practical remedy for all lamp-ills—good glass properly made. That's why they make good lamps better.

My Index is free.

Orange Orchards

Three Years Old Paying Big Profits

Located in the Best Citrus Fruit Belt in California

$125.00 per Acre

to secure a 10-acre orchard that will pay later on from $800.00 to $1000.00 net profit per year per acre.

Let us tell you how this can be done.

Absolute Security

for your investment and for large profits, is GUARANTEED in this the BEST ORANGE ORCHARD PROPOSITION ever offered. Your profits GUARANTEED by BOND and MORTGAGE on OTHER ORCHARDS of our own.

Only 200 acres will be sold in this way to advertise the tract of 3000 acres we are selling.

Frostless location, ABUNDANCE of cheap water, BEST CLIMATE AND SOIL in the whole State FOR ORANGES AND LEMONS.

Orchards 10 to 20 years old and clearing up to

$1,500 per Acre per Year

in this locality are proof positive of the value of our proposition.

Such an Opportunity

only comes once in a lifetime. Write or call NOW and let us

Show You.

We have the best proposition in the world for good, successful, responsible agents, who can SELL REAL ESTATE either on large salary or commission, or both, and we want the best representative obtainable in every city.

THIS MAY BE YOUR CHANCE.

It costs very little to write or interview us and LEARN of this UNPRECEDENTED chance to PROVIDE an EXCELLENT INCOME for the FUTURE, with COMPARATIVELY NO INVESTMENT of cash, and LITTLE TIME OR ATTENTION REQUIRED.

California Horticulturally

By JOHN ISAAC, Sacramento, California

NORTHERN CALIFORNIA GROWING.

I DO NOT KNOW WHETHER THE Southern California boom has overflowed, or whether Northern California is having a boom all of its own, but certain it is, that there is an unwonted activity in all lines of industry up here, and all through the Sacramento valley. Many of the large holdings are being subdivided, the farming population is increasing, and there are very many eastern farmers now coming out and settling in this section. Irrigation has taken an active start and population is increasing rapidly. The building of new railroads has had much to do with it. There is ample room all through the Sacramento valley for a vast population and there is also some of the best land on earth there awaiting settlement. There is no question but that the farming population of the northern country is sharing largely in the general prosperity.

HORTICULTURAL INSPECTORS.

Among the many bills which have been introduced during the present session of the Legislature, is one of especial merit, and one which will appeal to the fruit growers especially. This is to provide for the increase in the compensation of the Horticultural Inspectors from $2.50 per day to $3.50. When the present law was passed the smaller sum was fair compensation, but in the years which have elapsed, wages have been steadily on the increase, until the compensation of the Horticultural Inspector is below that of the common farm laborer, and as men with some knowledge and skill are required for the work, and very much depends upon them, it is evident that the pay is absurdly low, and the natural result has been that it is very difficult to get men who are willing to do the work for the rate provided. Assemblyman Prescott F. Cogswell, of El Monte, is the father of the bill which will undoubtedly become a law.

PLUM CURCULIO.

A correspondent states that the Plum Curculio will not live in California as our summers are too hot for it. We have also been informed that the peach yellows cannot stand our California climate. This is the same old siren song we have heard from the earliest times. We have so peculiar and beneficient a climate that whatever is good for us will flourish, and whatever is detrimental will perish. Wonderful climate! But for all that, we have seen all sorts of pests live and thrive when once introduced. The black scale has spread in sections where it could not possibly live, the purple scale came from Florida and lived, although that was impossible in our climate, and in short every pest which could not possibly live here has lived, spread and played the very old Harry with us when once introduced. It may be set down as a fact that wherever the food plant of any class of insects will live, there those insects will live and thrive as does their food supply. Wherever the apple grows, the codling moth will spread, wherever citrus trees grow, their pests will also grow, if once established, and while we may believe that we have the best climate on earth and that it is good for all sorts of things, it is just as well to take no chances on its being bad for anything which we do not want. We don't want to make experiments with the Plum Curculio, the White Fly, Peach Yellows, Rosette, or any other of the hundreds of pests which we have not got. It is easier and cheaper to keep them from entering, than to rely upon our climate disagreeing with them.

PEAR BLIGHT.

Reports from the pear blight sections continue favorable, and from all accounts the campaign waged against it by the agents of the Department of Agriculture has been successful. The deep discouragement, which took hold of the pear growers in the northern part of the state two or three years ago, has given way to a feeling of confidence in the future and the general impression is that the pear industry will still live and continue in the future as in the past, to be a paying one. As indicating the faith of the growers it may be stated that some very large plantings of pears are now being made in the sections where the blight prevails.

THE CAPITOL GROUNDS.

Grove L. Johnson has introduced bills in the legislature providing for the removal of the State printing office and the unsightly old pavilion which now encumbers the capitol grounds and the taking of the whole tract for a park. This is as it should be. These grounds should be used for other purposes than a park in connection with the State capitol building, and as it is at present a great part of it is devoted to factory purposes and a big ramshackle tumble-down, lumber structure which never should have been there. With these gone the grounds can be made one of the beauty spots of the capitol city and of the state.

SUTTER COUNTY ORDINANCE.

Sutter county has followed its sister county of Yuba in the adoption of a Horticultural Ordinance, the principal object of which is to exclude the Phylloxera and the Anaheim or mysterious vine disease. The ordinance adopted is an exact copy of the one in effect in Yuba county.

Queries and Replies

Soft-Shelled Eggs.

As a subscriber—vould you kindly give me some information through the poultry columns of your paper.

1. What is the cause of hens stretching their necks, open their mouth as if gaping.

2. What is the cause of one of my hens dropping her eggs during the night—I find them on droppings board of a morning, sometimes broken.

3. What is the cause of hens dripping their eggs in the yard—without a particle of shell.

My flock are leghorns.—Feed "Egg-food" in the morning, wheat at night in straw litter, on range during the day. They have ground oyster shells and lime in hopper.

I ask you the cause. Can you give me a remedy; you will greatly oblige, Amateur, Greenfield.

An irritation in the throat will cause the symptom you mention. The irritation may be from a cold and sore throat, some foreign substance in the throat or gape-worms, but we do not have gape-worms in this pleasant climate.

Soft-shelled eggs and eggs dropped out of the proper time are caused usually by wrong feeding. Over-stimulation by the use of spice or so-called "egg foods" tends to the production of thin-shelled eggs. Fright may hurry along the eggs before the shell has been added. Worms may increase in the intestines to such an extent as to stimulate the egg passage to push along the eggs beyond its usual distance. An over-fat hen has a tendency toward laying thin-shelled eggs, in fact this is the usual cause of soft-shelled eggs.

Provided the cause is an over-fat condition, you can meet this difficulty by providing a diet low in fat-producing elements, supplying good, sharp grit as well as oyster shell in abundance, making the birds work for their grain in deep litter giving the plenty of cut alfalfa.

A few doses of sulphate of magnesia (one heaping teaspoonful to a pint of drinking water) kept before the hens, allowing no other water on those days, twice a week will help remove the layers of fat. Avoid this unsatisfactory condition by feeding a well-balanced ration, not trying to increase the egg yield by means of any stimulant that does the work by an irritation of the egg organs, but furnish sufficient exercise to do all the stimulating necessary.—Mrs. A. B.

Bowel Trouble in Turkeys.

Dear Mrs. Basley:—Can you help me with my turkeys? We have poor luck, with bowel trouble. We have had some hatch all winter with poor results. We have had quite disagreeable weather all winter and the old turkey hens do not hover them as well as they need. Will that cause bowel trouble? Is there anything else besides lice or over-feeding that will cause bowel trouble?

We thought we would hatch some in an incubator, do you think that would be successful? I would like to know how to take care of them after they are hatched, to keep them warm enough and not have them crowd.

Do you think little turkeys that are on good alfalfa all the time need to be fed more than once a day or at all? I would like to know what the trouble is, so we can have better luck this year. Mrs. J. C.

The trouble is as you have surmised, that your little turkeys have been chilled by the cold damp weather and not being properly hovered, they may also inherit weak constitutions from their parents, but I think it is only from being chilled. I had the same trouble some years ago. You know my White Plymouth Rocks were bred to lay and when the little turkeys were being raised by a chicken hen she would desert them when very young and begin to lay. I then found that I could bring them up in a brooder, in a sheltered place and not lose one. Ever after I always brought up my young turkeys, if hatched under a hen or in an incubator, in my brooder. You feed your turkeys just right, but should not let them out into the alfalfa early in the morning, when it is wet with rain or dew. Young turkeys (and also little chickens) get bowel trouble instead of cold in the head from being chilled especially from a champ chill.

I hatched some turkeys in my incubator, but did not have as god hatches as under hens so, as the eggs were expensive I hatched under hens.

Nitrate of Soda for Lettuce.

How, under what conditions and when should nitrate of soda be applied to lettuce? In what quantity to every hundred square feet.—E. N. W., Pomona.

We have always found, in using nitrate of soda, that a great deal depends on the condition of the crop. Sometimes lettuce will make a quick growth without the use of nitrate; on the other hand, ofttimes the crop will be benefited by its use. The safest method in regard to feeding is for each grower to experiment on a small scale; this will give him a line to work on better than anyone else can advise, for the simple reason that soils vary so much in different localities. However, would recommend using nitrate of soda dissolved in water, say, a tablespoonful to a three gallon can of water, affording enough to give the bed a fair watering. Keep the water off the foliage as much as possible. The best time to use this fertilizer is after the plants are established in their permanent quarters when making their growth before heading.

Household Department

SOLITUDE.

Laugh, and the world laughs with you;
Weep, and you weep alone,
For the sad old earth
Must borrow its mirth.
It has trouble enough of its own.

Sing, and the hills will answer;
Sigh, and it is lost on the air.
For the echoes bound
To a joyful sound,
But shrink from voicing care.

Rejoice, and men will seek you;
Grieve, and they turn and go;
They want full measure
Of all your pleasure,
But they do not want your woe.

Be glad, and your friends are many;
Be sad, and you lose them all;
There are none to decline
Your nectared wine,
But alone you must drink life's gall.

Feast, and your halls are crowded;
Fast, and the world goes by;
Succeed and give,
And it helps you live,
But it cannot help you die.

There is room in the halls of pleasure
For a long and lordly train,
But one by one
We must all file on
Through the narrow aisles of pain.

—Ella Wheeler Wilcox.

A DETECTIVE'S STORY.

"We never know how a case is going to turn out," said the detective. "Sometimes we waste sympathy on people, and sometimes we don't give them sympathy that they deserve.

"Some years ago a young fellow (we will call him Lightbody—Lightbody's a good name for the sort of fellow he was) went to New York and got a position in a banking house. They said he was smart as chain lightning. At any rate, he climbed right up in the estimation of his employers, and soon he became their right hand man. But while they thought he was attending exclusively to their interests he was attending exclusively to his own. He was in everything where money is to be made or lost though where he got the capital to work with nobody knew.

"The fellow bit off more than he could chew and to save himself used his employers' funds, and about the same time Mr. Lightbody disappeared.

"A year or two after his disappearance it was reported to his former employers that he was living in a Central American state, and I was employed to go down and bring him back. The job was a delicate one, since there was no extradition treaty with the state in which he had made his home.

"Furnished with all the evidence I would need, including photographs, I sailed for Central America and on reaching my destination found that Mr. Lightbody was at the capital and a prime favorite with the Government. He had got some valuable concessions that were likely to make him rich. He had won the heart of the daughter of one of the prominent citizens, who was considered a very lovely girl.

"Of course I had letters to first-class people in my pocket, for I knew before starting that my man was cutting a heavy swath socially. I waited for some important function to let me in on an equality with the man I was after. A ball was given to which I was invited, and, getting myself up in the latest style of evening dress, I joined the throug. Of course Lightbody was there, and so was his girl. During the early part of the entertainment he was in such demand and was so devoted to his fiancee that I didn't even make his acquaintance. I saw them together frequently, and it was plainly a case of genuine love on both sides. I pitied the girl; but, as I have said, I had made up my mind to attend to business and let sentiment alone.

"Shortly before the ball broke up I joined a party of men in the supper room who were drinking champagne and smoking cigarettes. Lightbody was among the number. I made an effort to ingratiate myself into his favor and had some success. But he seemed anxious to get away, and I saw him soon after dancing with his girl. When the affair broke up I stood on the veranda keeping my carriage standing while I waited for Lightbody. Presently he came out with his fiancee and her mother, put them in a carriage, and they were driven away. Lightbody returned to the house, went inside, got his hat, came out, lighted a cigarette and was going down the steps when I stopped him and asked which way he was going. When he replied I told him that I was going the same way and would be happy to take him in my carriage. He accepted the invitation, and we got in and were driven away. We had not gone far before I said to him:

" 'Mr. ———,' calling him by his real name, 'how would you like to go to New York on the steamer with me?'

"He divined the situation at once. He made no reply for some time, then said:

" 'There's no extradition treaty between the United States and this country, and I could put you to some trouble but I'll go with you provided you won't give me away here and give me time to arrange my affairs. What do you say to that?'

" 'All I want is you. I don't want to peach on you. The steamer sails tomorrow night. Can you be ready?'

" 'Yes.'

"The next day the fellow gave out that he had been called to New York on some important financial business and said goodby to his girl, promising to be back soon. The next evening we sailed, arriving in New York in due time.

"I wondered how his girl would feel when she heard that he was an embezzler and had gone from her to state's prison. And here's where my refraining from telling her comes in. The affair for which he was wanted involved several people besides himself, and he was the only one not to blame. The others were his friends and had families. He drew suspicion away from them by flight. On his return he presented his schemes in Central America to the losers and agreed to take them in. This he did without informing on the real culprits. The losers, finding that far more money was to be made from his concessions than they had lost, accepted his terms, gave him funds, and in two weeks he was back on the isthmus more of a high financial f'ier than before. His concessions turned out to be very valuable and made him and his associates rich. He married the girl and became a permanent resident of Central America. There he is greatly respected, but in the United States he is still regarded an embezzler. He never threw the blame where it belonged.

" How do I know that he was innocent? Well, that would involve a breach of trust on my part. My profession never admits of telling secrets'.'—Frank P. Cheney.

WHY PASSENGERS ARE SLAUGHTERED.

While railroad telepraphers are paid $45 and $50 a month railroad accidents will occur and railroads will be guilty of criminal negligence.

The telegraph operator is too often a mere boy, whose appreciation of the gravity of his responsibility is not sufficient to prevent him from snatching forty winks and depending on his "call" to awaken him. Along the 223,000 miles of railway in the United States many operators sleep a part of every night on duty. Their responsibilities vary accordingly to their location upon the lines, but few of them have duties so unimportant that their negligence cannot cause wrecks. Familiarity with the Morse alphabet should not constitute a sufficient qualification for a railway telegrapher. Too often it is the sole requirement. While none but men of character and reliability should be employed, the "tramp operator," drifting across the continent, frequently secures work at a railroad station. And the train dispatcher is as weak as the weakest link in his chain of operators, no matter how capable and alert he may be.

FOR THE
RANCH

Khaki, corduroy and shawduck clothing for men and women; leather coats; rubber and oil skin suits; laced boots; rubber boots.

Tents; stack covers; wagon sheets; storm proof horse blankets; canvas mangers.

Fruit picking bags; feed bags; folding pails; heavy gloves.

Guns and ammunition.

Common carriers have no moral right to place the lives of passengers and train crew in the hand of irresponsible boys, yet the custom of sending green men to relieve regular operators is common, as is the custom of employing operators at salaries which do not command the services of men of character and ambition, but do attract the fly-by-night soldier of fortune who wrecks a train and takes to the bushes today only to reappear at some other point and secure another position.

There are, of course, honorable and trustworthy men whose services may be secured for twelve hours a day at $50 a month, but the calling of the railway telegraph operator should be made more remunerative to attract a more reliable class of men, and older men, and rigid examinations into the character and capability of operators should precede appointments to positions on the line. Legislation to compel railroads to fix a standard of qualifications is being talked of in Kansas, and is advocated by telegraphers. But legislation should not be necessary where improvement of the service would save in preventing damage suits and the destruction of rolling stock, far more than the increased expense for capable and reliable telegraph operators.—Louisville Courier-Journal.

GOOD ROADS AND AUTOMOBILES.

In a recent issue of the Cultivator, your editor said some good words about the growing importance of good roads. The subject is immediately connected with the proposition of how to utilize them; and when the means of transportation is considered, nothing can be thought of that is more important than the application of the automobile whose machinery is becoming daily better adapted to the various purposes for which it may be employed.

An event of the last month worthy to be chronicled, was the construction of a farm cycle, built in Los Angeles county, which will perform much of the work done in the fields without the aid of horses or of laborers. The machine is strictly an automobile, operating gang plows, harrows, or other farm implements. But the place this vehicle must occupy, is only the cultivated field or enclosure adapted to be farmed in such a way.

The means of transportation which the population of the State are to consider, is an automobile which will carry freight and passengers; a machine of each kind. The conveyance will be independent of but supplementary to our present railroad system.

Imagine an automobile transportation service which can be provided by the State, that shall cover every county of California. At all points where population must concentrate, the rapid transit facilities should be constantly increased. And as there is much danger of unnecessary monoply, which capital in the hands of a few will create, suppose this is capable of being lessened or prevented entirely by the "motor omnibus."

What could be better than a relay of coaches operating between points ten or twenty miles apart from each other? The tickets issued for the ride, to be paid for in cash, would be issued with coupons and stubs, and be transferable. The passengers would come in and go out as necessity required, arriving and departing at the relay point.

All repairs to the coaches could be made in the wayside repair shops established for the service.

For freight transportation, a different form of vehicles would of course be used, but the service would necessarily be slower, just as it is now in railroad practice. The farmer, the merchant, and the trader, as well as the settler, and miner, would find the much-desired help provided thus, which, today they are without, and which another generation will not see materialized so long as railroads alone exist.—Samuel Fox.

Citrus Markets

NEW YORK, Jan. 29.—The market is very much depressed on 80s to 150s, Poor stock selling very low. Weather clear and cool. Twenty three cars sold today. The first real taste of wint r has touched New York during the week just passed. A snowfall of nearly a foot impeded all traffic and rendered it practically impossible to do anything in the fruit business for several days.

A snowstorm of any magnitude in New York seriously interferes with the transaction of business. Fortunately the storm was not accompanied with dangerous cold so the losses sustained were chargeable only to delays in shipping.

TheJamaican disaster has created a good deal of discussion in this market during the week, partly because of the acquaintances which some of the fruit men have there and partly because of the effect it may have upon the fruit trade. Of course the damage if any, will not be felt this year as the season for Jamaica oranges is practically over.

The lemon trade has acquired a sudden and wholly unexpected interest. At the sale last week of 15,000 boxes of Massina and Palermo lemons, the auction was marked by active bidding, increased prices and much excitement. It is said by those who had been long in the business that they never saw such excitement at this season of the year. From the opening of the sale to its close buyers were on their feet bidding excitedly for the different lots offered. Prices advanced 15 to 20 cents a box as compared with the last sale and the auction was strong throughout. There was no weakness and no dullness.

Offerings of oranges have not been large and while there has been weakness in the larger sizes, intermediate sizes have declined and there has been some complaint of the quality of present arrivals. The conditions which have governed the market are not essentially different, but for some unaccountable reason the tendency at present is to ignore California and buy Florida.

It is stated in private letters from Florida that cold, wet weather has prevailed and that this has interfered somewhat with the picking of fruit. It is expected that actual shipments will fall below early estimates, though it is impossible to say how much until the extent of this weather injury is known. It is said that the inferior fruit has all been shipped, but that there is a considerable quantity of good quality stock to come. A car of Deerfield Grove Floridas were offered during the week. They brought record prices, as the figures show—176s, $6.87½; 150s, $5.00; 176s, $3.50@$3.87½; 216s-250s, $3.12½@$3.25.

Grape fruit in the same shipment sold high as well. The figures were—28s, $5.26½; 36s, $4.37½@$5.75; 46s, $5.75; 54s, $5.87½

The following are the prices obtained today (January 29.)

Corn Culture in Central California

Corn Field on King's River, Near Lemoore Courtesy of Nares & Saunders

IT IS gratifying to note on every hand that the farmers of California are rapidly taking a greater interest in the improvement of their corn. Questions are constantly being asked as to methods of improvement and where good seed of improved varieties can be secured. That many farmers are now willing to pay good prices for good seed corn is a healthy sign.

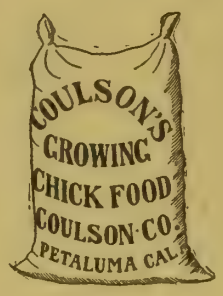
The average production during the last ten years has been very much smaller than it should be. Experiments show that the average yield might easily be very materially increased by a combination of a more careful seed selection, better cultural methods, and proper attention to the maintenance and improvement of the fertility of the soil.

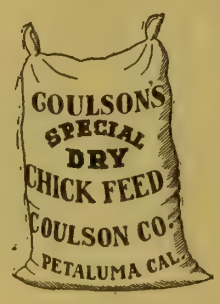
The prospects for improvement are very bright. Our farmers are awakening to a belief in the possibilities, and are beginning to make an effort in the right direction. We could point to quite a number of farmers in the State, working on average soils, who are producing a better crop every year, and their methods are not by any means as good as they might be. Large areas of the better lands are capable of producing, and are producing, even with comparatively poor methods, corn which rivals that of the Mississippi Valley, and in proof of this we would call the readers' atention to the above illustration of a field on the Laguna de Tache Grant in Kings County.

There is no crop that is more responsive to more careful selection of seed and better methods of treatment generally than is corn. A difference of from five to ten bushels per acre in productiveness is easily made and the crop of the State could easily be increased by several thousands of bushels in a single season without increasing the acreage, and at practically no greater expense. Conditions in many parts of California for corn production as to soil and climate are, for the most part, excellent and there is no adequate excuse for the low average yields. If every farmer would make a little effort, wonderful improvements could be quickly produced.

Lands that go through the spring until corn planting time without frequent surface tillage and the establishment of a good soil mulch, loses tons of water daily per acre by evaporation, not infrequently almost enough within a few weeks to mature the crop. A harrow or weeder will be effective in this work if used often and just as soon as the weeds come through the ground.

This method of tillage is comparatively inexpensive and may be practiced in crossing the field in any direction after the corn is planted and before and after it is up, without damage to the crop, until it is large enough to work with a regular cultivator. By following this method the most difficult and ordinarily expensive part of the tillage will have been accomplished by the time the plants are large enough for the use of the regular tillage implements. The mere killing of the weeds will then seem of minor importance and tillage will be looked to more for its effect on the physical condition of the soil than as a means of freeing the field from foul growth. Under hot California summer sun tillage for conservation of soil moisture becomes a necessity





Coulson's Growing Chick Food

Is a mash feed for the growing chicks, designed for feeding when you leave off feeding Coulson's Special Dry Chick Food, composed of articles, each the best in its class, combined in the correct proportion to form

A PERFECT BALANCED RATION

It contains blood meal, meat meal, bone meal, and other articles rich in protein, and the other elements, and is the feed you need to make your chicks excel in size and weight and enable them to become strong, vigorous and heavy-laying fowls.

COULSON'S GROWING CHICK FOOD WINS OUT

San Marcos, Cal, July, 23, 1906.
Gentlemen:

I tried COULSON'S GROWING CHICK FOOD exclusively my first year in business on Brown Leghorns. I sold the cockerels as broilers at nine weeks, averaging 2 pounds, 3 oz. each.

I tried my own mixture of feed the next year and took the same care of the chicks, and sold 75 cockerels as broilers, weighing 105 pounds, making an average of about 1 1-4 pounds each.

Having tested at my own expense the two methods I have concluded that COULSON'S FOOD is superior.

(Signed) J. B. HOOVER.

Coulson's Special Dry Chick Food

Is acknowledged by all The Best and most Reliable Feed for Baby Chicks.

The Improvement of Citrus Fruit Varieties

By E. J. Wickson, Dean of the College of Agriculture of the University of California and Acting Director of the University Experiment Stations, at the Special Citrus Fruit Institute in Riverside, January 22-24, 1907.

THE possibility of improvement of varieties of citrus fruits is obviously conditioned upon opportunity manifesting itself in desirability of different types, forms and characters from those now familiar to the commercial or amateur grower. It is idle in this stage of the advancement of citrus fruit production in California simply to indulge in a general exhortation of improvement or to suggest that change is desirable because it may secure something different. It is also true, as may be insisted upon later, that radical changes in the characters of varieties, which citrus plant breeders are attaining in the Eastern and Southern States, are not necessarily of any local value to California, and, from our point of view, may not constitute any improvement at all. We have followed a long and devious path of our own toward the excellence which we now possess and reference to it may be instructive to newer Californians.

It was my privilege as a young man to participate in the citrus fairs which were strong promotive and directive agencies in the early development of orange and lemon growing in Southern California. I remember the first held in Riverside nearly thirty years ago. Recent comers cannot appreciate the eagerness, the effort for close and correct discrimination, the enterprise to secure everything which had promise in it and to bring it to judgment, which were characteristic of the argonauts of Riverside and of the rival citrus colonies who ransacked the world to secure the golden fleece not of Kolchis, but of citrus excellence, which should prove effective in the success of their unique horticultural enterprises. The result of this world-search brought oranges and lemons from China, India, Persia, the Mediterranean islands and countries, the Gulf coast of the South, the West Indies and Mexico and from far and wide through Oceanica, until there existed in Southern California thirty years ago a larger collection of citrus fruit varieties than in any other single country under the sun. How the visitors at the fairs admired and praised; how the judges at the fairs analyzed and condemned them by dozens, reserving only a few for tentative favor. Praise was meet from the idle; merciless criticism was the only protection for those who were striving to lay the foundation for a livelihood and a competence. And so the motley crew of citrus varieties began to fall before expert judgment which, it must be acknowledged, was strikingly accurate and impartial because those who were called upon to execute it were trained to quick and broad conclusions through their previous participation in commercial, financial, educational and other professional affairs. The men and women who achieved the success of the citrus colonies of Southern California possessed probably a higher order of intelligence and a richer experience than were ever summoned to a single agricultural undertaking before.

Individual and committee decisions and growers' early results saved a few of the scores of varieties of oranges and lemons for wider and longer trial. Local pride intruded measurably also. Each district was willing to send its champion to tilt for the awards so long as chance remained to it, and local names were proudly given. Let me call the roll to awaken the memories of the pioneers: "Asher's Best," Wolfskill's Best." "Mayberry's Premier," "Baldwin's Favorite," "Wilson's Best," "Kerchevals Queen," "Riverside Navel."—These were some of the names to conjure with for prizes twenty-five years ago, because all these appealed to local pride and loyalty. There were a few more of general growth at that time, but they were neither here nor there. Out of the throng came one to survive, the Riverside Navel; but to become the universal champion it must forsake its early advocates and promoters and stand forth the Washington Navel orange of California.

I am indulging in these historical references to emphasize a fact which seems to me of ruling importance in this discussion and that is that California has attained singleness of purpose in the matter of citrus fruit varieties by a rigid and long continued process of selection, beginning with pioneer growers, following with pioneer traders and shippers, following again with analytical chemists, consumers and the general development of commerce and investment—every phase of it exercising the principle of selection in its own way, until, on the basis of its quality and characters and the wealth produced, the Washington Navel is the greatest orange in the world, which it was the dream and ambition of the pioneers to attain by their devoted and discriminating effort.

In order to be a little more specific as to the progressive rejection of varieties once esteemed, let me refer to records which I keep of the kinds which in any year seem to command attention of large commercial planters. The following is the number of such varieties in each of the recent years named:

	Oranges.	Lemons.
1890	22	9
1900	8	5
1905	2	3

I disregard in all years a few varieties which are either untried or appeal only to amateurs or are special types which certain growers plant in a small way for special trade. The two oranges which stand large are, of course, the Washington Navel and the Valencia Late; the three lemons are Eureka, Lisbon and Villa Franca, the first being greater than the other two combined and becoming relatively greater. There are, of course, more varieties of oranges and lemons commercially grown and they have some distinctive values which may bring them revival, but the contrast is limited to those largely planted at the time stated, because a man's belief is based not so much upon what he has as upon what he will pay to have.

It may be taken as established that close and long continued selection has given us two varieties which are of acceptable type and that these types are not to be wisely departed from. Each, however, is susceptible of improvement and it is interesting that each has its strength and weakness. In an effort during the last year to secure the conclusions of experienced growers and propagators as to what remained to be desired in the way of commercial varieties of the orange, I received the following replies from many different people, which I condense to a single declaration to each:

"A later Washington Navel to be good after May 1st; an earlier Washington Navel to be good before January 1st; a Washington Navel that will hang on the tree like the Valencia; that will not crack on the tree; that will stand hot sun better; that will be free from puffing, as the Valencia."

"A Valencia that will not turn green after maturing; a Valencia that will bear more regularly."

"A large seedless variety to bridge the gap between the Washington navel and the Valencia, and displace seedlings ripening at that time; also a variety that shall be as good as the navel and late as the Valencia."

Here we have each variety described, in part, in the terms of the other, and new varieties described in the terms of both. It is very clear that we have come to a definite attainment of what is desirable in a commercial orange for our California purposes and that whatever we do for improvement should include no serious effort to break from this type, but rather to enforce it upon any disposition toward variation.

Practically the same condition prevails in our approved varieties of lemons, for the following are described as desirable improvements:

"Increased disposition in the Eureka and Villa Franca to bear summer fruit and with resistance to frost like the Lisbon; a Eureka with more uniform shape, smoother skin and color like the Lisbon; a Lisbon with fewer or freedom from thorns like the Eureka."

In lemons then, no departure is needed from the type which has been determined by selection hitherto, but there may be new characters within the type. Before final suggestion is undertaken concerning this effort a brief reference to the asurance that we have correct types for our purposes may be pertinent.

The Washington Navel orange as it goes from California into the world's commerce is a combined product of grower's skill and climatic conditions operating upon its own natural qualities and characters. Neither of these factors alone could achieve its present position. The navel mark is neither peculiar to it nor determinative of it, for there are other navels which are inferior here and our navel is inferior elsewhere—even in Bahia, whence it came, it has no such quality and standing, because in coming to California it passed from humid, tropical to arid, semi-tropical environment. The tropical orange is not in the same class with the semi-tropical from the point of view of commerce. Trade in tropical oranges is local or limited; trade in semi-tropical oranges is world-reaching. The orange produced in an arid, semi-tropical climate is dense and compact, firm and better in keeping and carrying characters. It is also of more sprightly flavor and richer

Grafted Walnut Trees

Placentia Perfection

1000 First-Class Trees, 10 to 13 Feet High

These trees were raised for our own use and are the surplus over our requirements. Growers who have both grafted trees of this variety and common seedlings, say they would pay $5.00 per tree for Placentia Perfection Grafts, rather than plant seedlings. They bear earlier, the nuts are less subject to blight, and sell at a big premium, being unquestionably the most ***perfect nuts on earth.*** Address

Leffingwell Rancho, Inc., Whittier, Cal.

WALNUT TREES

grown from carefully selected seed

I have a fine lot of trees. Call and see them. Postal gets price list. **A. A. MILLS, Anaheim, Cal.**

WITH A SIEVERT OIL BURNER

You can burn 100,000 cubic feet of air with every 130 gallons of oil; this means perfect combustion. To burn more than 100,000 cubic feet of air with 130 gallons of oil, there is a decided loss of heat. To burn less than 100,000 cubic feet of air there is a loss of fuel.
The only safe and reliable burner on the market.
Send for full particulars.

SIEVERT OIL BURNER CO. 1001 No. Alameda St., Cor. Main and Ord Sts., Los Angeles, Cal.

Deciduous Fruit Culture

By J. W. MILLS

SPRAY FOR FUNGUS DISEASES.

IT IS safe to spray for fungous diseases any time from now till the buds begin to open when the lime, sulphur and salt remedy is used, even till the color of the flowers show. This is true only of varieties of fruit which leaf out after blossoming. Blackberries, for instance, cannot be sprayed with this wash just before blooming as they are then in full leaf and the wash is fatal to foliage. Bordeaux mixture may be used any time and not injure the foliage.

This mixture is often used to advantage in midsummer. The ideal time to use fungicidal washes is just before the buds open, but it is not practical because a long continued rainy spell, which is liable to occur at that time, would delay the work till the fungus spores grow, and in many diseases, curl leaf of the peach, for instance, the damage is beyond repair. When the spores sprout, they send out a thread-like growth called mycelium which penetrates the tissues of plants just as plant roots do the earth. When they once enter the plant tissue, no spray or wash will reach them. They grow and multiply even after the exposed part is killed.

The point to keep in mind is to kill the spores before they sprout. The sprays recommended for this purpose will kill the spores whenever it comes in contact with them. Late spraying is theoretically the best, because it leaves less time in which a new lot of spores may "blow in" and reseed the plants. However, as stated, it is best not to lose any time in spraying now, as rains may delay the work till too late to do much good.

STARTING A PEACH ORCHARD.

You will probably expect me to tell you how to prepare the land and the distance apart to set the trees, etc., after advising you to get the best stock from a reliable nursery, but such is not my intention. In fact, I will depart from the beaten path and outline a method that may bring down upon my head a storm of protest from the wiseacres. I am not opposed to the budded varieties, but the plan I shall follow combines the advantages of both the budded and seedling. It is a fact beyond dispute that seedling trees will bear three crops while the budded tree bears one, and it is also well known that the seedling will live longer. But look at the other side of the question, and we see that while the seedlings have borne the crops they are in many instances utterly worthless. However, it is a well-known fact that the best varieties are without exception a chance seedling, and that were it not or the seedling we would get no new varieties.

It is not generally known how easy it is to bud and graft, and the process is supposed by many to be some magic gift. Any one with ordinary intelligence may, with a little practice, become proficient in the art of grafting and budding. My plan is to plant the seed where you want the tree to stand, and allow it to become of bearing age before it is budded; then, if it is not desirable, it may be budded to some other variety.

In the first place, we know that the matter of locality has a great deal to do with seeds of all kinds, and I should endeavor to get seed from a near-by orchard if practicable. Many varieties of peach are nearly true to the parent tree, notably the Indian peach, and it is well to select seed from good varieties, although in some instances the best fruit comes from trees grown from seed that have been taken from very ordinary trees.

It is the usual plan to bud peach trees rather than graft, as is done with the apple. Budding may be done either in the spring or fall, or even in the winter. In budding these seedling trees, saw off the limbs near the tree and insert the buds, one or more in each stump. There are many ways of budding, but probably the best is to select buds from a twig of the current year's growth. Insert a sharp knife half an inch below the bud, cutting up as far above it; this will remove the bud intact with a small piece of bark, which should be inserted in the stock as follows: Make a horizontal cut in the stock, or stump, near the top, then another at right angles to the first, barely cutting through the bark where the cuts cross; insert the bud and push it down as far as necessary to hide the bark, leaving the bud projecting through the slit in the bark. Pull the bark down snug and wrap with soft strings. After the bud is set remove the wrapping. The method of winter budding which I give I consider more desirable in that it can be practiced when the bark will not slip, in winter or fall. Limbs three inches in diameter may be successfully budded. In treating large trees, cut away all the limbs to within four or five feet of the ground and select three or more to receive the buds. Insert the knife into the bark of the limb just as if a bud was to be removed, and draw it downward about an inch, pressing the cut back a little to keep it open; cut the bud from the scion as for ordinary budding and lay it on the cut surface, after which place the flap back and tie it firmly, the bud thus being completely covered. As an additional precaution, I would suggest that a piece of waxed cloth be laid over the flap before tying. Where buds do not stick in the summer, they may again be tried in the winter by this method. Not one in a hundred will fail, and I have known six-year-old peach trees thus top-budded in March to bear a good crop the succeeding season.

In starting an orchard in this way, you will be only one year later than if year-old trees were set from the nursery, and you have the satisfaction of knowing that when you once get a desirable variety it will endure for a good many years, and will be a source of much greater profit than any budded tree. Even the seedlings that are top-worked will have the advantage of the good root system and will have all the vitality of a seedling. If desired, the young trees could all be budded before they came into bearing, but this would defeat the main object sought, the only advantage being that they would not have to be transplanted. A variety that would prove a boon to the peach growers may be dis covered in this way, but the chief advantage of this system lies in the fact that a man may leave posterity an orchard that will endure and one that will produce crops every year.—[Journal of Agriculture.

Little courtesies are the wayside flowers of life.

LIME SULPHUR SPRAY.

The Piper formula, or 1:1:4 wash, is prepared by using one pound of lime for every pound of sulphur. First take the lime in the cooking vat. Then add the sulphur and enough more water so that the mixture will stir easily. Stir the mixture constantly while it is coming to a boil, and continue brisk boiling for one hour. When the boiling is completed dilute with water until there is one pound of sulphur to every four gallons of spray. The diluting may be done with cold water, in or out of the spray tank or in any manner convenient to the operator. The solution should be strained as it is run into the spray tank. This formula requires no salt. The old, or California formula, using salt, is well known to those who have prepared it in the past, and so it is unnecessary to discuss its preparation here. The old formula has given perfect satisfaction and so there is no risk in continuing its use. The new formula has not been used here, but there seems to be no reasonable doubt that it should succeed as well in this locality as it has elsewhere. The advantages of the new formula are that it is easier to prepare, cheaper and less difficult to apply.

Instead of preparing this spray the farmer may purchase it in concentrated form, as there are several commercial brands now on the market.

It should be remembered that the purchaser of a proprietary article is usually taking some risk; that the material may not be up to guarantee; and, further, it may prove more expensive than the home-made compound.

FRUIT INSURANCE.

E. P. Sandsten in Bulletin No. 110 of Wisconsin station, says, "Spraying is an insurance and every fruit grower should be a policy holder." That sentence covers the ground completely. Many farmers do not realize why they get so small returns from their fruit trees. They buy trees, set them out and give them no more care than they do the willow storm hedge.

The trees must fight weeds, rabbits, mice, climate, fungus and insect enemies all alone. Then the farmer wonders why the trees die, or fail to give good fruit. They get disgusted, curse the nurserymen, say there is no money in fruit, and let the orchard go, to be a breeding place for the diseases and enemies of other orchards.

There is no sense in such an attitude. The farmer who neglects his stock or his grain crops as he neglects his orchard will have as complete a failure with them. The man who says all breeders are dishonest is one who does not take proper care of the full-blood that he buys. He, himself, is at fault. The man who will raise fruit trees and neglect their sanitary conditions is as much a curse to the fruit growing section as he who has no regard for the sanitary conditions of his live stock.

But the law makes a man burn or bury his dead hogs and prevents him from selling diseased stock. This is true in some States regarding fruit trees, but not in all. Too few realize that trees need sanitary care. They will dip sheep and hogs, but neglect spraying fruit trees. They will have a veterinarian operate on diseased horses and cattle, but they leave diseased and dead branches on the trees to do further damage.

Fruit insurance consists in proper cultivation and care of the trees, and spraying at the right time with the right chemicals for a specific purpose.

WINTER SPRAYING.

The object of winter spraying in this section is twofold. First, the control of various scale insects, chiefly the San José scale. Second, the improvement of the condition of the tree by the removal of moss and other growths. A number of sprays have been recommended for this purpose, but it is the opinion of almost every expert on the subject that the lime sulphur spray, more commonly known as lime, salt and sulphur, answers all requirements best. The properties of this spray are well known, and may be briefly stated. It is a fungicide, it is an insecticide, it removes mossy growths, it improves the general condition of the tree.

All of these properties are not possessed by any other known spray, which properties recent investigations of the Washington experiment station have shown to be due to lime and sulphur in solution. The solution is formed by boiling the two ingredients together in water.

Sorting Olives

HEAVY FRUIT PLANTING.

From the quantity of nursery stock now being imported into our state it is probable that there will be a larger addition made to the deciduous fruit area this season than ever before in one year. Reports are that trees by the car load are arriving in nearly every county, and this in addition to all that are supplied by our local nurseries. It is evident that popular faith in fruit growing as a profitable industry, in spite of the difficulties which accompany it, is not abating.

The national forest preserves now aggregate almost 100,000,000 acres, acquired within two or three years.

An Edge Test

Perhaps your knife, when newly sharpened, will cut paper, but whittle hard wood for a few minutes—then try it. If you want a Knife, a Saw, a Chisel, a Plane, a Drawing-knife, or any edged tool that will hold its keenness through long, hard service ask for the kind marked

With the Citrus Growers

By J. W. MILLS

SOLVING PROBLEMS.

SIX YEARS or more ago there was warning given about the damage done oranges by pickers, teamsters and graders; faults were found in all the different departments of the industry. Attention was called to all the weak points of the business, but very few efficient preventives were employed. An old staff writer, Mr. James Boyd, wrote columns on the subject, under the different heads of "Careful Handling of Fruit in the Orchard," "Teamsters," "In the Packing-house," "Labor" and all the different phases.

Why was it that no particular progress was made in careful handling. It seems to have been because the hands did not know how. They thought they were careful, but being ignorant of the nature of the injuries, they could not know how to guard against them. It required some person who could properly analyze the proposition and classify the different kinds of injuries, determine exactly what movement of the operation produced them and demonstrate how to avoid making them.

Every Southern California orange grower knows that Mr. Powell did this, but the lessons taught by him will not end with his orange investigations. He has made it easier for growers to look into and analyze their various problems as they arise. They have been shown how simple it is when once started aright, and a little thinking when started right makes all the difference between success and failure.

BLACK SCALE PARASITES.

Some one or many parasites combined which might render artificial attempt at extermination of the black scale unnecessary, is a blessing that the orange growers have been praying for, for a long time and Mr. J. W. Jeffries in his able paper before the recent Citrus Institute at Riverside touched on this subject, and told of the unsatisfactory results, in most places, derived from the Scutellista, which promised such quick relief. He also told of the black scale parasite recently introduced at San Diego from China, and while he was hopeful of good results he warned citrus growers not to count on it till they had demonstrated to a certainty that they could keep the scale down to numbers where they can do no harm. Ever then we cannot hope to do away with washing, at least. It is a well recognized law that these insects never can be totally exterminated, as it is impossible for the parasites to clean them out of all places at the same time, and as the supply of the parasite increases, and diminishes there must be a supply of food for them. An approximate extermination of the scale means the same for the parasite.

Some years ago, a fungus appeared that was found beneath every black scale on some trees in certain localities and it was thought that a natural exterminator for this scale had at last arrived. It was a very wet season that this fungus appeared and the scale was completely eradicated from an olive orchard under our observation.

The fact that it was during a wet season prevented us from throwing up our hats and shouting. The next season brought scale and no fungus, and so it continued till last season when it appeared on scale in all trees with dense foliage. On trees which were open and dried out as soon as the sun came out, no fungus appeared. As 90 per cent. of the scale on the fungus infested trees was dead by Scutellista before the fungus appeared, it would seem that dead scale might have been the chief, if not the whole attraction for it.

In 1898, about the time we observed this parasite, Dr. S. M. Woodbridge experimented with this fungus by making clean cultures of it on bread. This was distributed by him with varying results. Further effort in this work soon died out as unfavorable climate conditions completely destroyed the fungus growth. One or two short periods of unfavorable weather will check it so that it is rendered useless for the season.

COMMERCIAL FERTILIZERS.

Does it pay to use commercial fertilizers? Nothing is easier than to make this trial for yourself. Experiment upon a small portion of your crop, sufficiently small to occasion no inconvenience in the event of failure, but large enough to enable you to judge of its effects. Treat this experimental portion as rec ommended in the following notes. A few dollars will cover the cost of such an experiment, and the results will enable you to contrast the action of the fertilizer even more satisfactorily than if the whole had been manured. If the crop responds to this treatment, you will be justified in looking forward with confidence to a similar benefit on treating the whole of the succeeding crop in the same manner.

There is absolutely no doubt that a rational system of fertilizing combined with proper cultivation, will enable the farmer to improve his crops, in spite of the fact that the soils may apparently produce an abundant crop, but the fertilizing must be done scientifically that is, rationally.

FERTILIZER TESTS.

It is evident that in order to ascertain whether the use of fertilizers really pays, a practical field test must be made. This is done by setting apart a small patch of a certain field, solely for this purpose. This patch must be divided into a number of squares of exactly the same size, designated by small pegs, driven into the ground indicating the various squares. The whole patch must be treated exactly alike in the way of ploughing, cultivating, etc.

By treating some squares with fertilizers and others not, the contrast will soon be apparent, subsequent comparison of the yield will show exactly to what extent the crop has been increased. Figuring the extra yield over and above that from the unfertilized squares at market prices, and deducting from this the cost of the fertilizer, will give you an exact idea of the benefit derived from the use of fertilizers.

CROP REQUIREMENTS.

In connection with rational fertilizing we have to consider the following points:

1. What are the chemical requirements of the different crops?
2. In how far does the soil meet these requirements?
3. In what direction are they to be assisted by fertilizers?

Concrete was recently successfully used in patching a great hole in a ship's bottom.

CITRUS FUNGOUS DISEASES.

In animal so in vegetable life; a vigorous well-fed individual withstands disease while the weak, starved one succumbs. The pomelo is naturally a vigorous grower and we are probably not far astray, when we say that compared with sweet orange trees of equal size and age they require from one-fourth to one-third more fertilizer. In a number of instances poorly fed trees have been attacked on leaf, branch and fruit by the disease, while better nourished ones immediately adjoining showed no signs of its attack.

The remedy in this case is obvious. Where trees have been badly whipped by the wind, causing abrasions on the fruit and branches and tearing the leaves, the disease adds to the injury already done. The wounded spots are very readily attacked. On the other hand trees standing in still areas, where is little or no air movement are more subject to attack than are those about which the air circulates freely. The trees should not be subjected to the whipping force of the wind, neither should they be so hedged in or walled about by standing timber as to prevent a free circulation of air. In the matter of forest protection the middle course should be pursued.

The disease usually follows injury to the leaves, branches and fruit by frost. The spores of the fungus gain access to the tissues through the part injured.

Trees suffering from Die-back, Foot-rot, or any other disease are more subject to the attacks of Anthracnose than are those which are entirely healthy.

These devitalize the trees and puncture the tissues thus making it possible for the fungus to gain a foothold. Among those insects which appear to assist in increasing the attacks of the fungus may be mentioned the different scales and mites in particular. Spots upon citrus leaves immediately beneath clusters of long or purple scales are generally found to be diseased and it is probably not too much to say that insects open up the way for the fungus to enter leaf, branch or fruit.—[Florida Bulletin.

PLANT EXPERT RESIGNS.

Herbert J. Webber of the bureau of plant industry, has resigned from the government service to accept a professorship at Cornell University. Dr. Webber has been in charge of the plant breeding experiments of the Agricultural Department. He entered the government service in 1892.

He has produced new varieties of long staple, upland cotton, regarded as a valuable contribution to scientific agriculture. He also has developed a hardy orange capable of withstanding a severe frost. When this result was obtained, however, instead of being a hardy orange, it was found to be a composite fruit with the combined characteristics of the orange, the lemon and the tangerine.

Dr. Webber will not take up his duties at Cornell until next spring, when he will take charge of a now department of the university, to be known as the department of experimental plant biology.

An Improved Farm Level.

An improvement in farm levels which gives promise of usefulness in irrigation and drainage work, is announced in this issue of the Cultivator. The claims made are for simplicity and ease of operation. It is called Bostrom's Improved Farm Level, and is sold by the Palace Hardware Company, 456 Golden Gate Ave., San Francisco.

When writing advertisers mention Cultivator

RED AND PURPLE SCALE.

A few Covina orange growers have demonstrated to their satisfaction, that the purple and red scale can be killed by gasing with cyanide and not injure the trees in the least. The usual strength was increased till it was advanced to three times that amount, but the gas was generated slower and tents left on for a greater length of time. It looks some time to get the proper adjustment but they now claim that they can kill these scales and not injure the trees. Mr. S. A. Pease of San Bernardino, has made the same claim. This is, however, very expensive and when it comes to covering large trees, they must give good returns to warrant such treatment.

The Stover Gas Engine Again.

About a year ago mention was made in these columns of the rapid strides made by Livingston & Lee in introducing the Stover Gas Engine into this field.

Since that time the expectations of that firm have been more than realized. They not only succeded in selling several carloads of these engines in face of strong competition but they are also able to report that every engine they have installed has been a grand success.

They pride themselves on the fact that they have been able to overcome the car shortage difficulty and freight blockades and now have a full carload on the floor which has made remarkable time from the factory, so that they are in a position to supply customers with anything from two to forty horse power at once.

Taking the hint from remarks made by their competitors, this firm has taken the precaution to lay in a large stock of extra parts for all size engines and now have these parts on exhibition. This, together with the fact that Livingston & Lee are connected with the shops of the Commercial Engine Company, puts this firm in a position to meet all demands that may be made for extra parts for Stover Gas Engines.

They are looking forward with pleasure to the yearly visit of Mr. J. F. Smith, Secretary of The Stover Engine Works, which is expected in the first week of Feburary. These visits by the Stover representative are without doubt a great benefit to both agent and consumer, as it puts the factory in a position to understand the needs of the different localities.

The Stover people report that they have been making tests with alcohol for fuel in their engines with great success and have ready an attachment by which any of their engines can burn alcohol with small expense to consumer for the change. In other words they are keeping up with the procession.

The main features of the Stover are its simplicity of design, and its great strength both as to general construction and in actual horse power developed. The speeding device mentioned before in these columns has proved very successful and a number of well-boring outfits in and around Santa Ana are using Stover Engines for power on this account.

On the whole Livingston & Lee have cause to be well pleased with their year's work, and any one interested in gas engines will find their sales room at No. 953 North Main street, well worthy of a visit.

We are sometimes apt to think our Canadian cousins are rather slow, and perhaps they are, but facts show that many of ourselves are taking notice of things across "the line." In 1896 official records showed that 49 Americans went into the north-west of Canada to settle, but in 1905 it was stated: "The bone and sinew of the Mississippi Valley have been moving into Western Canada for the past four year to find farms and fortunes." We fancy often that Alberta Province like the extreme north is a region of icebergs and polar bear, but when we learn that the sugar beet factory at Raymond turned out two million lbs. of sugar last year our pre-conceived ideas are somewhat staggered.

Waggs—I hear old Miserly has untold wealth?

Jaggs—Who told you?

Waggs—The tax collector.

The Venus of Milo explained: "I twisted 'em off trying to fasten the three middle buttons in the back," she announced. From this it was easily inferred that she had no husband.—

GREAT LAND OPENING IN CALIFORNIA

We are opening the Western side of the Sacramento Valley under irrigation for the first time. PRESIDENT ROOSEVELT has signed a Special Act of Congress granting our great Central Canal 45,000 miner's inches of water from the navigable Sacramento river, enough to irrigate 200,000 acres. Rich, black sediment soil; free water right, best in U. S.; climate unexcelled; all fruits and vegetables grow to perfection; rail and steamboat transportation to ready markets. 10, 20, and 40 acre tracts from $30 to $100 per acre—terms, one-sixth cash, the balance in five years. Excursion rates from all Eastern points after March 1st. Rates from Los Angeles now in effect. For information and literature write or call on F. E. ROBINSON & CO., 216 Pacific Electric Building, Los Angeles, Cal.

When writing advertisers, mention Cultivator.

The Difference
Comes Out of YOUR Pocket

A common kind of "Bucket Bowl." Heavy, hard to wash, easy to rust.

SHARPLES Dairy Tubular Bowl. Simple, light, durable, easy to wash.

If you don't **know** that Sharples Dairy Tubular Cream Separators are **different,** take no chances until you find out. "Bucket bowl" agents depend on catching the fellows who **don't** know. Don't let them take the difference out of **your** pocket. One difference is in the bowl.

Shake The Insides Out!

Before you buy a separator shake the insides out of the bowl. It will show you how heavy, complicated, hard to wash, easy to injure, quick to rust, "bucket bowls" are as compared to Dairy Tubular bowls. **Sharples Dairy Tubulars are different.** Nothing inside Dairy Tubular bowls but a small dividing wall of triple tinned pressed steel—no bigger than a napkin ring—good for a lifetime. Yet Tubulars have twice the skimming force of any other separator—skim at least twice as clean.

You have common sense—want to save your wife work—want to save yourself repairs and cream—so why not learn about this now? Our free catalog N-260 shows many other exclusive Tubular advantages of great importance to you. Also ask for free book, "Business Dairying," covering everything from calves to butter.

By Mrs. Minna E. Sherman, Fresno, Cal.

THE HORSE.

MY table contains two requests that I shall write on the horse as we raise and care for him on the ranch. While I try to avoid personal topics as a rule, still as I have had the request I will for this once comply.

Horses are money in these days, big money! I hope many of the farmers have grade drafters for sale. I fear not, for they have not been breeding them, thinking the auto trucks would take the place of the horse in the larger cities. In the disaster that overwhelmed San Francisco, the auto truck has proved not as good as the horse and wagon on the broken up steets. Nearly three hundred horses a month have been the death roll in San Francisco during the past months. These have been able bodied, not decrepit, worn out horses; the replacement will hold the market up for sometime.

It is a pitiful sight to see the horses straining to draw heavy loads of bricks over the broken up streets in San Francisco, as pitiful as the towering ruins of the familiar buildings. The fact that the work in reconstruction is being done by individual contractors, instead of by a general municipal organization adds to the expense, had the work been under one head, the dreadful mortality of horses could have been saved. A sound work horse today of 1700 pound weight, sells readily for $250 and upwards, without even having the cockle burrs cleaned out of his tail. Fancy match draft teams of 1900 weight, sell readily at $800 to a $1000. Driving horses of 1000 to 1300 pounds weight sell at $175 to $500 each, while ponies under 800 pounds that two years ago sold for $40 each, now bring upwards of $100.

Young mules are even higher than drafters, if they have size and are well broken. It seems to be the time for the farmer to breed his mares to a good draft stallion. The expense of raising a colt to the age of three years old here on the ranch, including the feed of the mare during the time she is off duty is $36.00; add twenty for stallion fee, and the expense comes to $56.00 when ready to do a full days work.

Age for Work.

At two and half year's old the draft colt is ready to do half a days work. He can be halter broken and put into harness within two weeks. As he is then docile, and easily handled, any one with patience can drive him from the first day he is hooked up. Put him in with a gentle horse that pulls steadily at slow work, the plow being the best. It is an error to put the draft colt on the road. He jars his shoulders and soft muscles, even his joints are soft and the body fat is not yet as hardened into good muscular condition. Like Hamlet, he is fat and scant of breath, so do not force him to move fast, let his head be checked low, and see that the harness fits him well, particularly the collar. Now remember he is only a great big baby, use him gently, pat him along, and if he wishes to stop to catch his breath before reaching the end of the plow row let him. Many a good draft horse is soured by rushing him as a colt; if he grows sour he will later become a balky horse, but in the Percheron this is not a characteristic fault. In the hundred we have raised, from pure breed to the scrubbiest sorts of mixed blood dams, we have never had a balky one,—only two that were kickers. These kicked like a cow with one hind leg at a time.

The shoulders of a colt have to be watched at first, for it will not do to allow them to become sore. When the collar is taken off have it wiped off carefully, then wipe the horses' shoulders, and with the palm of the hand rub the flesh gently until the circulation is restored. During the first three months it is well to work the colt only half days, then if he has held his own in flesh, he can be given a full days work. When the colt loses flesh, he is worked too hard, and even the half day may prove too much for him, and he should be worked only alternate half days, to fit his strength. It is important that he is not worked down. for it will stunt his growth sadly if he has a set-back at this age.

Owning a Stallion.

The farmer at this time sees the opportunity to make money if he owned a stallion. The eastern horse companies also see an opportunity to unload a lot of stallions. The confidence game is played not by selling a crippled or diseased horse, but by making the farmers pay more than he is worth. A man comes to town with four or five beauties of stallions, he talks of them and enthuses the farmers into forming a club; they pay part cash, and give individual notes for the balance. Now, I was told by a man selling me a horse last year that he had sold directly to purchaser and also by companies. I asked him why he took the two forms of doing business. He said that they exploited a neighborhood, and wherever they found no one owning stallions, they sent a man to form companies. They got nearly double the money from company or club that they could from an individual for the same horse. That is, a fifteen hundred dollar horse, could be floated as a company or club horse for three thousand dollars, that men buying in a bunch each felt his share in the horse was not costing much, and it did not matter as much as though it were a one man bargain. Then also a good salesman could make believe they had the cream of horse flesh in their stallion.

I believe this to be true for I have seen a numbr of company horses around the State and when told what they cost have marvelled, why I could buy for so much less than that horses as good and with as good a pedigree. Eighteen hundred dollars to $2000 will buy extra good stylish draft stallions, while unsound stylish one can be boubght for $800.

The farmer with less than fifteen mares, had better try to make special yearly prices with the best horse in his neighborhood, rather than own his stallion. It is usually very unsatisfactory to own an interest in a horse, for a little carelessness and the horse dies of pneumonia, or some other disease.

We have usually about a hundred head of broken horses on the ranch, and thirty weanlings and sucklings. The geldings are sold off as soon as

See Us for Sanitary Milk Bottles. O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

well trained, the grade draft mares are sold when they have given us three or four colt,. usually at seven years old. The pure bred registered dams are kept to raise stallions for the market. When a common mare proves to be an exceptionally fine breeder she is retained longer, but the idea has been to bring the stock of grades up in weight to the full-blood standard, and each generation was one more cross with the heavy blood.

The carriage horse stallions have been of our own raising and we have done well with them in getting sound, handsome, kindly colts, with a good amount of speed. It is foolish to breed to a mean stallion, the man that keeps stallions shouuld see that they live a normal life. The draft stallion should work in a wagon at draft work on the road and fa m. Our carriage stallion is driven by the wise man to his buggy, or to the phaeton. I feel safe to drive him to town at any time. Kindly stock can not be sired by crazy-header stallions, the level hearedness is inherited from dam and sire alike.

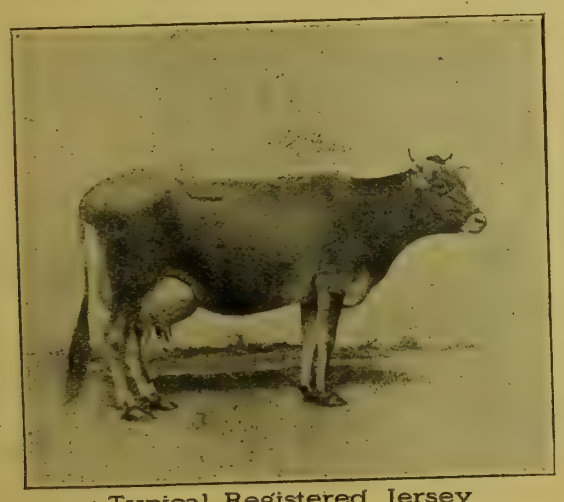
MISTAKES IN DAIRYING.

In an interesting paper on why dairying frequently does not pay, Wilber J. Fraser, chief in dairy husbandry, Illinois University, gives the following suggestions in the Jersey Bulletin.

Americans don't take to the idea of chains and slavery, but many an Illinois dairyman has unconsciously drifted into the condition of the man in the picture shown with this article. He is not chained to a fellow prisoner or to a post, but to a common (altogether too common) brute—to a worthless, willful cow.

He don't know where he is going; he simply follows the cow. That's how he got tied up to this creature; he didn't know what he was doing, nor what the cow was doing—or rather what she wasn't doing. In fact, there's been altogether too little looking and doing in this man's business.

The dairyman has blindly followed without figuring; he has worked hard with his hands, but little with his lead pencil, and the dollars have come his way very reluctantly. And as for the cow, the only thing she has done right well is—the dairyman; she is "doing" him beautifully. If the dairyman ever gets hold of that big key there'll be "something doing" in that dairy! He will soon hand over his end of the chain to the butcher.



Typical Registered Jersey

The Cow is not Worried.

She is not disposed to look on the dark side of life as long as she can go where she pleases and get a living without earning it. Thus far she has found no trouble in pulling her owner along without his asking any questions, and she now feels sure that her milk record will never be inquired into. She doesn't know about the key within his reach.

That chain had never galled her shoulder, but she has plenty of gall for all that. She has been satisfied to make 133 pounds of butter fat in a year and to return to her owner a clear profit of 77 cents in those 365 days. If the dairyman had 474 cows of this kind he could make from them just one dollar a day! With that he could keep body and soul together.

Not A Rare Specimen.

But do not mistake this cow for a rare specimen of an almost extinct family. On the contrary, she is very common and popular on all our prairies. She is a cow of consequence and not to be sneezed at and dismissed from mind. She is in fact, a leader; she leads that dairyman (and a great many others) where she will, while she grazes contentedly.

She also has a following of one-fourth the million cows in Illinois—250,000 of them have learned bold assurance in using the dairyman's feed and barn and time and capital for a cent-and-a-half a week per head. This cow is right now doing a great stroke of business in Illinois dairying. The only stroke that can ever get ahead of her is the stroke of the butcher's mallet on her head.

It may be said to the credit of this cow that she is not a vicious animal. The dairyman has nothing to fear from her horns or her feet. She is a well-be-haved creature, familiar to every farmer, and usually there is nothing suspicious about her manner.

But when it comes to remorseless stealing of the bread from the mouths of the dairyman's family, her tribe may well be classed with the great business sharks. She has kept the dairyman of this State out of fully five millions of dollars the past year without the slightest shame or nervousness. And yet the dairyman follows this cow as though he had never known freedom from such an encumbrance. The dairyman who says that

Dairying Don't Pay

Is ten to one boarding several cows of that kind in his herd.

The dairyman is not exactly easy in his mind. That chain is heavy and tight, but he has carried it so long he thinks that burdens belong with dairying, or he lays the blame to ill luck or a poor price for milk; or perchance he says he can not afford to keep good cows, forgetting that he could less afford to keep poor or worthless ones.

But see, the hands of science and the most successful dairy experience have provided him a key to the situation. As soon as ever he sees it—O, that he might see!—he will make use of the scales and Babcock test and find out what every cow on the place is doing for him—or against him. Armed with that knowledge, faithfully furnished by the dairy and agricultural press, he will never follow that pious old fraud of a spendthrift cow again.

The cow for this dairyman stands behind him. She has learned the knack of turning feed into milk and butter fat. She represents the average production of the best fourth of the dairy cows in Illinois (300 pounds of butter fat per year,) and the dairyman should get acquainted with her. She is a better cow than he thought.

In fact, he has not thought enough about this cow or known how many such are in his herd. He can not know

Without using the Key—

Weighing and testing the milk of each cow for the year. He would have a vastly easier time of it if he were tied to this cow, and to this cow alone.

And as sure as he uses the scale and test and comes to know each cow's production, he, like all other dairymen who have tried it, will gradually change his herd to this kind of high producers. And that will inevitably lead to more profit in his business—to better education for his family, to a more comfortable home, and to the conveniences and privileges that go with real prosperity.

The faults and failings of the worth-

HOOF HINTS.

The sole of the horse's foot should be kept perfectly level, as any undue weight on one side of the foot may lead to injuries of the joints. All loose horn should be removed, and the wall of the hoof levelled with the sole. The bars should not be cut away, as they act as natural braces to the heels, and the frog is to be left in its normal size and shape to act as a cushion for the foot. After the foot is brought to its normal form the shoe should be made and fitted to it. The shoe must be of the exact size of the foot, so that it will come flush with the outer edge of the hoof. The nail holes should not be very close to the edge of the shoe, for in that case it is necessary to drive the nails too far up into the wall to make them hold. The shoe should be fitted cold, or just touched to the foot while hot, never burnt into position. The nails should be small and when driven should be brought out well down into the hoof. If driven too high, when the horse is reshod the former nail holes are near the edge and serve to weaken the hoof and interfere with the driving of new nails. After the shoe is fastened the nails are to be clinched in small grooves placed for the purpose. After this is done the clinches may be smothed with the rasp, but the outside of the hoof should not be rasped, as this will remove its natural protective covering.—Dr. N. S. Mayo.

"So you are on a star tour," said the circus lion to the dancing bear; "pray tell me is that fellow there with the chain your manager?"

"Yes," replied the bear, "and also my leading man."

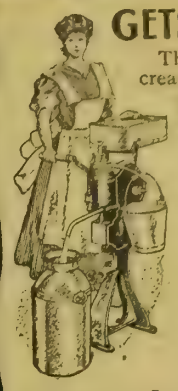
GETS BIGGEST PROFITS FROM MILK



The chief reason you want a separator is to get more cream—more money—out of your milk. Then if you want to get the most you'll naturally want the separator that gets the most cream. That's the improved

U. S. CREAM SEPARATOR

Holds World's Record for Cleanest Skimming.

It's the bowl that skims the cream. Inside the U. S. bowl are only two, simple, easy-to-clean, strong parts, but it gets all the cream—the World's Record guarantees it. Our free, new book shows four pictures of the bowl, explains why it skims cleanest and how it made the World's Record.

Also shows the solid low frame, enclosed light-running gearing, simple, automatic oiling device—everything about the construction and operation of the U. S. 27 pictures.

Just mail us today a postal card asking for "Construction Catalogue No. 120" and learn all about a machine that will get more cream—more money—for you.

A Noted Herd of Jersey Cattle

A great opportunity is now offered to secure one of the finest herds of Jersey Cattle, one which California has not seen in many a day. It is the famous

Gen. W. R. Shafter Herd

Which was gathered together without regard to expense, the only demand being **quality.** "Is she a doer as well as a good looker?"

In this herd, some bred originally by Shields, Pierce and other best breeders and later some by Gen. Shafter himself, are many prize winners. A detailed record of each animal will be sent on application.

The whole herd will be sold in a body if satisfactory bid is received by Aprll 1st. After that individual animals will be sold.

W. H. McKittrick, Executor W. R. Shafter Estate
Bakersfield, California

less cow have cancelled or concealed the profits of the good cow, just as human idlers are a tax upon their fellows. The good cow has to do the work for both. Not knowing the production of either, the dairyman has overestimated the poor cow and underestimated the good one.

One cow of the good kind, producing 300 pounds of butter fat per year, is actually worth to the dairyman more than forty cows of the other kind. When the dairyman knows the good cows in his herd—knows how good they are—he will be just as anxious to tie to them as they are willing and faithful to serve him.

When will the dairymen start the rebellion (and the test,) throw off his fetters, and fill his barn with the kind of cows that are glad to earn him good money and make possible a better way of living for his whole family?

PUMPKIN TESTS—COW FEED.

The pumpkin in some form or other has always been palatable to the people of the Northern section of the Union. The very first poem by a New Englander has a stanza in its praise. Whittier's poem on pumpkin pie is known to all, as is Riley's celebrating the season "when the frost is on the punkin an' the fodder's in the shock." Wherefore, it is not surprising that that thrifty and enterprising people have tested its merits as a food for milk cows.

A writer on proper foods for the Eastern States observes that he has found in the feeding of pumpkins that he can give about 4 pounds per day per cow with advantage, and with some cows the milk production will be greatly increased. He has had occasional cows, however, to lay on fat and decrease their milk production from this food. He thinks there are few experiments to which we can point relative to the value of feeding pumpkins. In one experiment there was a gain of 6 per cent. more milk when they were fed than before they were admitted into the ration. This was the result, too, when the dry matter was so decreased in the ration that the increase of milk based on the units of dry matter in the food, amounted to 10 per cent. The milk did not in any way deteriorate in quality. In another test the cows fed on pumpkins produced 5 per cent. more milk than cows fed on silage, and where compared with dry hay the increase was great.

It has come down as a saying of the foreparents that pumpkins will make the cow go dry. The practical views of the "old folks"—based on experience—are often serviceable today. But it is probable that, if any tendency from feeding this ration was toward drying up the milk, it was due to feeding the seeds. This could be obviated by separating the seeds from the pulp before feeding.

Because of their abundance and the ease with which they are grown, it would not be a bad plan for the farmers to give them a little more attention. In the Eastern States they are fed in the fall and early months. In California they can be kept all winter.

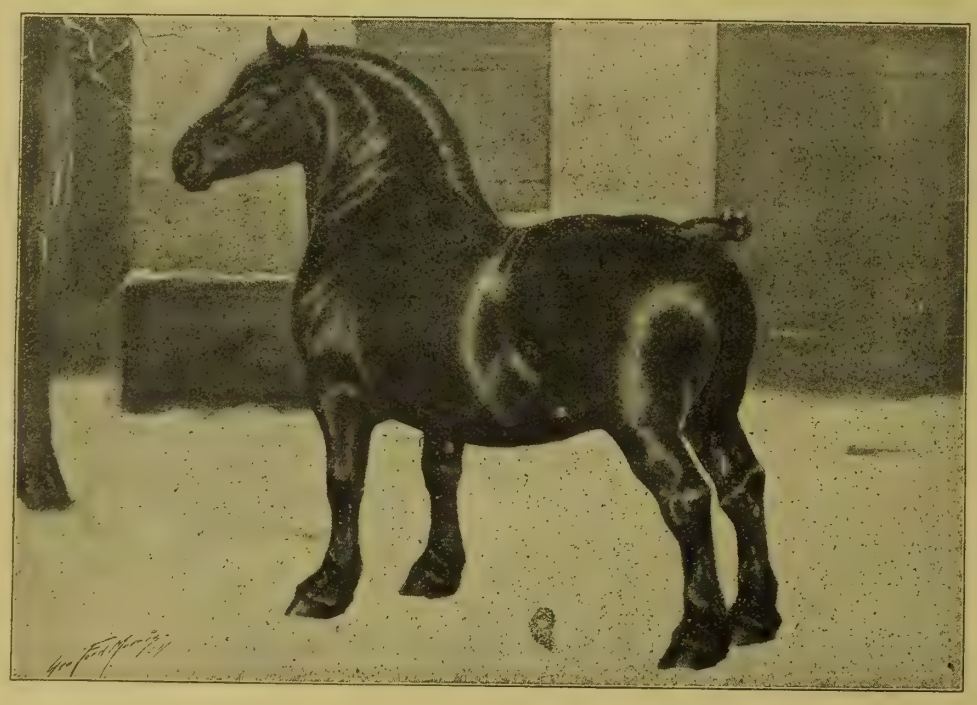
FEED FOR DRY COWS.

Too often persons neglect to give the cow that is dry enough feed. They think she does not need much to eat when she is giving no milk.

This is a mistake. At that time the unborn calf is demanding much of her vitality. Any sort of fodder or roughness is offered her, in the hope that she will get through all right.

It is held that the people of the city slums are degenerating because of an insufficiency of food. In some instances public school children are being given free a meal a day, where it is seen that they have not had proper nourishment at home. It stands to reason that the lower animals need the right sort of nourishment to keep them going, too. You may give them a large amount of musty hay or rotten nubbings, but you need not flatter yourself that either will make them thrive. Might as well feed them too little as to throw down something they cannot eat.

The Emperor of China has the finest tea gardens in the world.



Trappiste No. 1899

The illustration above shown is the largest Belgian Stallion in America and also in Belgium, his native country. He took first prize and the Grand Champion prize at the St. Louis Fair in 1904, and at the California State Fair in 1906. He weighs 2375 lbs. This stallion is said to be the greatest living draft horse in the world, and has more honors gained at expositions than any other living stallion.

Trappiste is now a California horse and his get will soon manifest its influence on the horses of this State.

Chicago, Ill. July, 1906.
Tuttle's Elixir Company.
Gentlemen:— Boston, Mass.

I thank you through your agent, Prof. C. F. Tuttle, 311 East 63rd St., Chicago, for what Tuttle's Elixir has done for one of our mares. She had been lame in one of her hind legs for some two years and couldn't work one-half the time. Your agent pronounced the trouble muscular rheumatism and gave me directions for treating with Tuttle's Elixir. I followed these directions and am pleased to report that for the last four months, the mare has not lost a single day's work. She is now entirely well. Have used your remedies on other horses with most satisfactory results. John B. Frye., Barn Supt. Bowman Dairy Company. 76th, and Wentworth Ave.

The California Fertilizer Works have opened a southern office at 216 Grosse Building, Los Angeles, under the management of Mr. W. J. Benjamin. Have also just completed four new warehouses, hoping to be able to supply more promptly the increased demands for their product.

The Southern warehouses are located at the following places: Pomona, Ontario, Arlington and Riverside.

Home Light.

Farmers are recognizing the great convenience of a good light, and we are frequently in receipt of enquiries as to which gas machine will give the greatest satisfaction at the smallest cost. We do not care to go on record as making your selection, but the Superior Generator has always met the requirements in the line of a gas producer, and the fact that it sells at a moderate price makes it doubly attractive. The country home is deprived of a great comfort if it is not supplied with gas.

The Superior can be arranged to supply gas to any house, whether old or new, and the entire piping can be done by any gas fitter.

The Superior Light and Heat Company have a catalogue which they send to all readers of the Cultivator who write for it. If you state the number of lights you use they will give you full information as to the cost of the size generator required and the expense of installing it. You will be suprised to learn how reasonably it

The Louse Question

When your animals rub incessantly at this season of the year, look out for lice. This is especially true of calves and colts. To meet this condition Dr. Hess (M.D., D.V.S.) formulated the famous Instant Louse Killer, which kills lice on stock and poultry.

INSTANT LOUSE KILLER

kills ticks on sheep. It, being a powder, can be applied in zero weather. Do not wait for warm weather; do not let the tick eat up your profits; kill him on the spot with Instant Louse Killer. Put up in round cans with perforated top, full pound 25 cts. Sold on a positive written guarantee. Be sure of the word "Instant" on the can; there are 25 imitators.

1 lb. 35 cts. 3 lbs. 85 cts.

If your dealer cannot supply you, send your order to us.

ISLAND BRED JERSEYS.

About two years ago I read in a pamphlet published by J. O. Terell & Sons of San Antonio, Tex., this statement. "About 15 per cent of the Herefords and 20 per cent. of the Short-horns (Durhams,) that are purchased in England for transportation to the United States, are condemned by our health authorities because found to be afflicted with tuberculosis, but not a single case of tuberculosis has ever been found among the importations of Jerseys."

A few months ago there was published the per cent. of cattle afflicted with this disease, which stated the various breeds. And while the per cent. was less for the Jerseys than other dairy herds there was not a great difference. This was published in the Cultivator. I immediately sent the clipping to Mr. Terrel. Mr. Terrel advised me that he would immediately take the matter up with parties in Washington, D. C., whom he had heard declare many times what he had published.

This is the letter from R. H. Hickman, chief of Quarantine Division:

"Referring to your letter of the 10th instant inclosing a clipping from the California Cultivator, I beg to advise that the tuberculin tests of Jersey and Guernsey cattle by Dr. T. A. Geddes, bureau inspector in Great Britain, were not made on the Islands where these cattle originate. Cattle coming directly to United States from the Islands of Jersey and Guernsey are not tested with tuberculin, while cattle of these breeds imported from England are tested. Please find herewith inclosed marked copy of B. A. I. order 109, regulations governing the importations of animals subject to inspection and quarantine.—R. W. Hickman.

To any one who may doubt, this is an overwhelming proof of the contagiousness of tuberculosis. There is none on the Islands and none can get there, for importations are prohibited. But let these Island bred once in England and they must be tested less they may have caught the plague, and tests show some of them have.

Tuberculin test for cattle.

The following is the regulation referred to by Mr. Hickman:

All cattle over six months old imported from Great Britain directly into the United States, which are subject to quarantine, except as otherwise provided, shall be tested with tuberculin by an inspector of this department, stationed in that country, or after arrival at the animal quarantine station at the port of entry.

Cattle from countries not otherwise provided for shall be tested in the said quarantine station. All cattle so tested, which show a reaction shall be prohibited from entry into the United States or be disposed of as provided in section 10 of these regulations. Cattle imported into the United States directly from the islands of Jersey and Guernsey may be admitted without being tested with tuberculin. —J. M. H., Los Angeles.

J. A. Ryden of Arcata, has brought from Rasmus Anderson the registered Holstein-Friesian cows, Grace of Warren Creek and Queen of Warren Creek.

A rabbit hunt on an extensive scale is planned for the Elmwood section of Stanislaus county on February 14th. Everybody is invited. The plan is to use shotguns and to advance across the lands in a long line.

For a Good, Practical Milking Machine see the O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

THE SUPERIORITY OF THE MULE.

The mule is less nervous than the horse and therefore loses less energy in useless fretting. In fact, one of the chief characteristics of the mule is his ability to take care of himself under all circumstances. Much of the apparent shirking which is charged against the mule is an inborn tendency to husband his strength and make every effort count. The result of this instinctive care on the part of the mule is that he is able to turn out more work than would be possible for a horse of the same weight under the same conditions. The mule instinctively avoids holes, sharp obstacles, barbed wire fences and various other forms of danger which are not so successfully avoided by horses. It is a matter of common observation that in instances where mules run away they seldom injure themselves to any serious extent. In mining, mules are quite superior to horses for the reason that they seem to understand the requirements and dangers of the work more clearly than horses.

When Dehorn.

Please tell me at what age to dehorn a calf?—S. B., Gridley.

Calves may be dehorned when four days old. Clip hair from around rudimentary horns and rub with a stick of caustic potash, but this is a mighty poor way and a mighty poor time to dehorn. Read Mrs. Sherman on the subject in recent issues of the Cultivator.

Do Healthy Animals Need A Tonic?

This question is often raised among users of stock foods. They ask the question." Does a person in health need medicine?"

It is probably true that if stock were fed for the same purpose that the human being is nourished, there would be no occasion for the use of medicinal tonics under ordinary conditions.

We have most of us learned by experience the evil of over-eating, and endeavor to select foods most agreeable to our digestion. Furthermore, we exert an effort to consume only sufficient food to sustain life and repair waste. In fact, we do not aim at putting on weight, and in many cases just the opposite result is hoped for, but if the cow, steer or hog would be given only sufficient food to sustain life and repair waste, no gain would be perceptible; we fully realize that the food consumed that doesn't produce additional weight or milk is entirely wasted, the profit, therefore, being derived from the food consumed in addition to that which is required to sustain life and repair tissue.

Over-feeding, threfore, is a necessity; and the results similar, as in the case of the human. Then again, the animal has not the opportunity of selecting the foods most suitable to its digestion.

Medicinal stock tonics, therefore, must be entitled to a place in the economy of skillful feeding, and the stock preparations that contain the ingredients that have been tested in the medical institutions of our country and found valuable, are being sought after by a large percentage of expert feeders.

Dr. Hess Stock Food is the product of science; it is the result of Dr. Hess' twenty years' experience in the study and practice of medicine, both human and veterinary.

It contains the bitter tonics long known in medicine for improving the appetite and increasing the flow of juices necessary to assimilation; it furnishes the animal system with iron, the greatest of blood and tissue builders; together with the nitrates of sodium and potassium which assist nature in eliminating poisonous waste material from the system, and relaxatives which regulate the bowels.

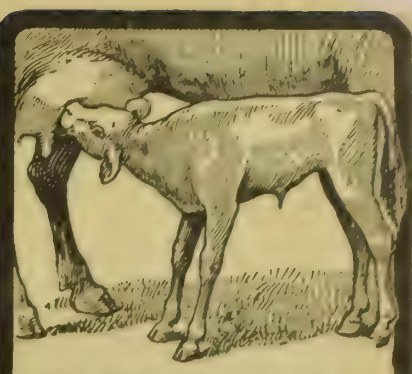
Anyone doubting the virtue of a formula of this character has only to refer to the medical authorities of the country or to his own physician or veterinarian.

If you have never used Dr. Hess Stock Food, write to Dr. Hess & Clark, Ashland, Ohio.

If Dr. Hess Stock Food fails to increase growth and milk production sufficient to pay for itself many times over, your money will be refunded.

This newspaper indorses our guarantee.

Cream Separators, all sizes, all prices. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.



STOCK INSURANCE.

Dr. Hess Stock Food insures a healthy condition of both dam and offspring; it also counteracts the danger of over-feeding. Think of the vitality given off in milking and the strain on the system due to calving. Then you can form some idea of the necessity for tonics. Stock fed for market are also over-fed continually and need something to assist digestion. Professors Winslow, Quitman, Finlay Dun, and all noted authorities, recommend bitter tonics for improving digestion—iron for the blood, nitrates for assisting nature in throwing off poisonous waste material from the system. Such ingredients are incorporated in

DR HESS STOCK FOOD ATONIC

The Prescription of Dr. Hess (M.D., D.V.S.), and besides it is

Sold on a Written Guarantee.
100 lbs. $7.00
25 lb. pail $2.00
Smaller quantities at a slight advance.

Where Dr. Hess Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our Government recognizes Dr. Hess Stock Food as a medicinal tonic and this paper is back of the guarantee.

If your dealer cannot supply you, we will.

BEST OF ALL THE CLIMBING PLANTS

The following collection of vines could hardly be improved upon. Special attention is called to the Japanese Honeysuckle, Scarlet Trumpet Creeper, and Variegated English Ivy, all possessing so many exceptional qualities that we believe everyone will want them. Both the Creeper and English Ivy are new. All the varieties named below have been brought to the highest state of perfection by the Chas. H. Lilly Co. The descriptions give a condensed idea of their differing characteristics and unusual excellence. Each will fulfill far more than ordinary expectations. Note our Special Offer.

LILLY'S BEST By improved methods of packing, we ship roots and plants LILLY'S BEST to the most distant parts of the United States, guaranteeing arrival in perfect planting order. Maintaining the high degree of excellence set forth in our ads and catalogue year in and year out is the secret of our prestige as the leading Pacific Coast Seed and Plant House.

JAPANESE HONEYSUCKLE.

This magnificent climber is as well adapted to United States growth—particularly on the Pacific Coast—as in its native clime on the Japanese Isle, where, for many years, the little brown people, so fond of nature and flowers, have been improving and perfecting it, until now it is probably the peer of all varieties in this class of plants. A sturdy, rapid grower, and needs little tying, if any. In sixty days after planting puts forth a marvelous mantle of green, luxuriantly clustered with dainty white flowers turning to yellow; blooms constantly. Delightfully fragrant, and brings the rare perfume of the Orient to your very doors. Cleanly—free from insect pests. In Western Washington, Oregon and California retains its foliage entire year. Will transform your arbors, porches, or fences into bowers of beauty. Each, Postpaid, 25c.

BELGIAN HONEYSUCKLE.

Sweet Scented Monthly—Noted for continuous production of large trusses of splendid red and yellow fragrant flowers, also for its rapid growth and mass of heavy leathery green foliage. One of the best Pacific Coast varieties, but stands a very severe climate, and therefore desirable for planting anywhere. Each, Postpaid, 25c.

SCARLET TRUMPET CREEPER.

Bigonia Radicans—This splendid hardy vine is new, and will be a great favorite as it becomes better known, for it is a strong, rapid grower and its flowers are both luxuriant and striking. As name signifies, the blooms are trumpet shaped—about 2½ inches in length—and a beautiful orange red. For rock work, crevices, ledges, and any purpose to which a climbing vine can be put, it cannot be too highly recommended. By supporting stem and proper pruning to tree shape, it is also very effective. Particularly adapted to Pacific Coast soil and climate; does well in dry soils, rooting deeply. Each, Postpaid, 35c.

VARIEGATED ENGLISH IVY.

A new variety, and bids fair to be the most popular of all Ivy strains, as its merits become better recognized. Has every advantage of the hardy old English Ivy, but instead of solid green leaves, foliage is mottled with white blended with a delicate trace of yellow and a faint touch of red, making a highly pleasing effect. The handsome foliage remains the same the year 'round — a very attractive feature. An excellent vine for walls, trellis, trees, fences, etc.; also fine for window boxes, hanging baskets, etc.; grows practically everywhere. Each, Postpaid, 25c.

VIRGINIA CREEPER.

American Ivy—The well-known Woodbine, one of the most rapidly growing climbers—hardy in any climate. Foliage deep green, assuming brilliant shades of yellow, crimson and scarlet in the fall. So well known that further description is unnecessary. Our stock is the very best, and all of vigorous outdoor growth, from our famous Brighton Beach Nurseries. Each, Postpaid, 25c.

HARDY ENGLISH IVY.

The ever-popular "old faithful" variety, with its rich, lustrous, dark green leathery leaves; known and found everywhere, massed in luxuriant growth over porch, wall, house, fence and hedge. One valuable characteristic is that it retains its beautiful color—fresh and green — summer and winter alike, also growing fully as much the latter season as the former. Each, Postpaid, 25c.

SPECIAL OFFER.

One each of the six described varieties, total value $1.60, carefully packed, prepaid, to one address, FOR ONLY $1.25.

LILLY'S 1907 SEED CATALOGUE.

Will be sent free, postpaid, on request. Lilly's 1907 catalog surpasses all previous books in attractiveness and completeness of plant information. It is thoroughly dependable and besides containing descriptions, price lists and culture directions for thousands of varieties of seeds, bulbs, roots and cuttings, is also a handbook on poultry foods and supplies, stock foods, fertilizers, garden supplies, sprays, horticultural supplies, etc. If you want one, free, mark an X in the white square.

HOW TO ORDER.

Mark an X in each white square opposite variety of plant you wish, mark quantity in square or on margin, figure up total, clip out ad., and remit in same envelope with clipped ad. Be sure to write name and address plainly, using blank below.

The Ornamental Garden

By ERNEST BRAUNTON

FEBRUARY WORK.

NOW IS the golden time of all the year for gardening and every day should be counted lost on which no garden work is accomplished. Unless unlooked-for and unusually heavy, unbroken rain falls all dormant plant life will begin to respond to the genial warmth of spring and the rapidly increasing power of the sun will stimulate them into growths all but marvellous.

There is scarcely any question but plant life has received all needed moisture during the past two months, but with returning activities more moisture and a constant fresh supply will be needed. See that plants now springing into seasonal growth have the soil loosened about them so that it will receive and hold the moisture; also keep up proper cultivation, not alone to conserve the moisture, but to destroy all weed seeds as soon as they sprout.

Lawns may now be fertilized, likewise roses and all real hardy plants. Do not, however, bother with bananas, cannas, elephant ears, callas and plants of this class, for they are unresponsive for some time yet and the soil being over-full of moisture, the fertilizer will be washed away before the time when the plants can use it. More than that, we may have frosts which will farther damage or even kill some of these tropical foliage plants that have little or no bulb or corm below the surface.

Get rid of all rubbish, beds of dry leaves and such stuff by burning. Garden pests, both insects and fungous diseases, are wintered over in rubbish and may now be effectually destroyed. If left to hatch out and multiply they may soon increase an hundred-fold and prove serious menace to some pet crop of flowers—"a stitch in time saves nine," and "an ounce of prevention is worth a pound of cure," are good maxims for the gardener to keep in mind.

PLANTING ORNAMENTAL TREES

The best and surest successful results with deciduous ornamentals will be obtained by first of all having wherever possible a rich, deep, mellow soil which is well drained, either artificially or naturally. The holes should be dug at least two feet in diameter and two feet deep, according to the size of the tree. The first foot of top soil should be placed on one side of the hole and kept separated from the remainder, as it is the richest, and will be needed in planting the tree. Trim off all the broken and bruised ends of the roots with a sharp knife, preferably by a slanting cut.

Take the tree from the bale or box or trench and subject the roots to a mud bath as previously described. The little fine rootlets being then covered with a sticky mud act as tiny magnets, to which the dry particles of soil adhere closely, supplying it immediately with plant food as soon as the rootlets start to grow.

In planting care should be taken that the tree when fixed in the soil should not be much deeper than when in the nursery, and that the top soil is as nearly as possible placed in and around the roots without leaving any cavities.

Do not put manure, and especially fresh manure, in the bottom of the hole so that it will come in contact with the roots. It is nearly sure to burn them. When there is a hardpan near the surface of the ground it will frequently be found necessary to blast through it and secure drainage, although poplars and willows, which are water loving trees, can be grown well without drainage, providing the hole is made large enough to supply it with sufficient soil for its nourishment.

In watering, care should be taken not to leave a depression directly around the stem of the tree in which water will gather. When the weather is warm this puddle of water becomes exceedingly hot, and is almost sure to injure the bark and cause the tree to die.

INSECT PESTS.

Numerous insects and fungi infest garden plants. These must be watched for, and attacked just as soon as they appear. The best all-round insecticide for biting insects (all beetles and "worms") is Paris green. Nearly every one now knows how to use this material. It is, of course, very poisonous. For sucking insects (as plant-lice) kerosene emulsion is a standard remedy. White hellebore is useful in some cases, if fresh, as for currant-worms, and is safer than Paris green to use on fruits and vegetables that will soon be large enough to eat.

The standard fungicide (for mildew, many kinds of blights) is Bordeaux mixture. Following are simple directions (written by John W. Spencer) for preparing it:

The three essential ingredients in the preparation of Bordeaux mixture are:

1. Sulfate of copper (bluestone.) As a preventive against the growth of fungus.

2. Lime. Chiefly to overcome the corrosive action of the copper sulfate, which is injurious to foliage.

3. Ferrocyanide of potassium (yellow prussiate of potash.) To indicate when enough lime has been mixed with the copper sulfate.

Fill a barrel, a half barrel, or a keg, as your needs may require, with water. One gallon of water at ordinary temperature will hold in solution about three pounds of copper sulfate (at 60 degrees Fahrenheit water will hold in saturated solution 50 ounces of the sulfate.)

Therefore, if you wish to avoid the trouble of weighing the copper sulfate, hang in a gunny sack in the top of the barrel of water a little more of the sulfate than will dissolve in twenty-four hours or more; the water will then contain approximately three pounds of sulfate to each gallon. Thus, when a gallon of the solution is put into the spray-barrel, three pounds of copper sulfate will go with it. A more accurate method, of course, is to weigh the copper sulfate to formula. Copper sulfate may be kept in solution for many weeks.

Air-slaked lime should not be used. Take the best freshly burned lime. Select enough lumps to cover the bottom of a water-tight barrel. Pour on the lumps enough water—hot water preferred—to cause the lumps to crumble into a fine powder. Repeat the process until the barrel is one-third to one-half full of slaked lime. Then fill the barrel with water to within six inches of the top. By keeping the lime covered with water it may be kept all summer without deterioration, as may the copper sulfate when dissolved. Both will then be ready for immediate use at any time.

The Vegetable Garden

By ERNEST BRAUNTON

SOIL PREPARATION.

TOO MUCH attention cannot be given to the preparation of garden soils. The writer has experimented along this line for a number of years and has never tried a crop that did not respond nobly and satisfactorily to deep turning and loosening of the soil.

Many people, in early spring, where sowing lettuce and radish seeds are heard to say: "Oh, my soil is light and friable and such seeds just grow and bring good results by just raking them into the surface without spading or plowing."

Two years ago the writer was gardening in the lightest and most friable soil to be found, soil that never did and could not pack hard and cement-like. This soil had grown mixed garden crops the previous year and had been freely cultivated and was in fair condition.

Two plats were selected and sown to the same seeds, three sorts of lettuce and three sorts of radishes. One bed was disturbed only to the depth of about two inches and the other was double-spaded, that is, a furrow across the bed was spaded and the bottom of this furrow was spaded up. No fertilizer was used except a little sown on top of each bed and this was extremely light.

The crops from the deep spaded beds were little short of phenomenal. Never before, in nearly twenty years experience, did the writer ever grow such satisfactory crops of the two esculents above noted. Next year four beds were so treated, spaded at four different depths, and results were in accordance with the depth of the seed bed. The value of deep stirring of the soil is beyond question, but we have occasionally to try some experiments like the above, in order to see what the profit over ordinary soil scratching.

After planting, soil tillage is just as necessary if we are not situated to irrigate easily and cheaply when desirable, in order to conserve the soil moisture. It is also advisable to keep the soil well aerated, more especially while the plants are young and the root system undergoing its most rapid development. After a time, when the fruiting or maturing stage arrives the roots harden up, cease their activities somewhat and it little matters about air and water supply.

HOT BEDS.

Vegetables are of two classes, those which are hardy and will mature if sown or planted in the open ground in early spring, and those which are benefited by having the growing season artificially lengthened by being started under glass in a miniature hothouse—a hotbed. This is a frame or box with a transparent covering and furnished with artificial heat.

The size of a hotbed is computed by the number of sash required to cover it. An ordinary sash has a surface area of 3x6 feet. A bed covered by four sash is called a frame. A single sash has capacity enough to grow plants for a family of six. How is the bed prepared? Choose a dry, sheltered spot in the garden. Dig a pit 18 inches deep and 12 inches wider and longer than the size of the frame. Fill the pit with fresh horse manure, packed firmly and evenly. Place a thin layer of straw over the manure. This serves to distribute the heat uniformly to the soil above. Now place the frame, which is 10 to - inches high, in position, cover the manure with 3 or 4 inches of fine soil, and put on the sash. A light cover of oiled muslin may be used instead of glass if the sash can not be employed. The sash should slope southward.

The manure will heat up rather violently at first. After the heat begins to subside, and when a thermometer shows a temperature of 90 degrees in the manure, the seed may be sown. A pit may be dispensed with by piling the heating material in a compact heap on the surface of the ground and placing the frame on top. In this little glass-covered house sow the tomato, egg-plant, cabbage, and cauliflower seed and such other things as need an early start. You will probably have room also for some of the annual flowers which need a little "coddling" in the fore part of the season in order to reach the blooming stage reasonably early.

THE HOME GARDEN.

The housewife cannot undertake it alone. She must enlist the interest and sympathy of husband and children. Make the children partners in the enterprise. If possible give each a share in the receipts from the sale of products as well as in the work of caring for the garden. The garden should prove a source of revenue. Long Island farmers sometimes make a profit of $1000 from a single acre in one season. This is done by thorough tillage and by using every foot of surface area. At least two crops are grown each season.

Consult your agricultural papers for seedmen's advertisements and write for catalogues. Order standard varieties at first. Try novelties in a small way. Take your children into your confidence and let each have a part in making out the order. Each will have a special interest in some one fruit or vegetable. This will do much towards stimulating interest at first, and the products themselves ought to keep it alive. There is joy in garden-making, and there is health in "garden sass." Let us help you in any way we can. Insects will invade, and diseases will appear. The bulletins of the experiment stations describe remedies for various kinds of enemies.

The 1907 Girl Yours for the Asking.

Have you made her acquaintance? Now is your only chance. After much trouble and expense, The Sharples Separator Company, of West Chester, Pa., have succeeded beyond their hopes in producing from life, in the softest and daintiest colors, the sweetest dairy maid that ever graced a cream separator calendar or was ever offered by any cream separator company as a free picture suitable for framing. This calendar and this free picture are like the Sharples Dairy Tubular Separator— you can't appreciate either of them until you see them. Worthy a place in every home. The Sharples Separator Company will send the calendar with this picture on it to you, free, for the names of two neighbors who keep cows but have no Tubular Cream Separator. Or they will send free the same picture, made larger for framing and without the calendar pad attached, for the names of five neighbors who keep cows but have no Tubular Cream Separator. Calendar and picture both sent free for the names of seven neighbors who keep cows but have no Tubular. Write at once before the supply is gone, sending two names for the calendar with smaller pictures on it, or five for the large picture without calendar pad attached, or seven for both. You must mention the name of this paper to get them. Address The Sharples Separator Company, West Chester, Pa., Chicago, Ill., Toronto, Can.

Bees and Their Care

ENEMIES OF THE BEE.

IT is more than probable that the bee moth is considered one of the worst enemies of the honey bee, and works more destruction than all the other enemies combined. If such is really the case, then we can consider ourselves fortunate, for there is a way to overcome this destroyer. When we hear a person complaining that the wax worm has killed his bees, we may be sure that he understands very little about bee culture. The fact of the matter is that nearly all summer long there are plenty of moth millers flitting about the apiary, seeking a place to deposit their eggs. Should they, perchance, find a hive that has only half enough bees to cover its combs, they are ever ready to avail themselves of an opportunity, and so begin immediately to lay eggs in the empty combs. In a few days the wax worm hatches and begins to feed upon the combs and fill the space full of weeds. The moth miller is possibly attracted by some odor, it may be the wax, the bee bread or something else about the hive. If possible, she goes to the combs, or else she lays her eggs as near to them as she can get. I have frequently had combs attacked that could not possibly be reached by the moth. The eggs hatched and if possible the larvae proceed at once to feed on the pollen or bee bread, tunneling the combs and fashioning their silken runways. If the comb is not close at hand, they are guided by a sense which in insect life is more delicate than we can understand, and commence operations. The means for prevention are very simple; try to keep all colonies strong. Should you, however, have some weak ones, take away the combs which they are unable to use, and give them a frame or two of hatching brood from some strong colony which is able to spare them, and give the strong colony the empty combs, which they will quickly make use of.

Ants are also considered an enemy to the honey bee. They have been known to destroy many colonies; especially in the South, where, in some localities, it is necessary to mount the hives on legs, and keep the legs smeared with soft tar. But here in New Jersey, so far as I have learned, the ants care more for the warmth of the hive than they do for the honey. Every spring I find ants under the hood of my hives, and hundreds of eggs, too, but I have never found any in the body of the hives where the bees and the honey are.

Toads are also without question enemies to the honey bee. It seems strange that anyone should keep bees for any length of time without finding out that toads are among their worst deadly enemies. They operate very stealthily, and have a way of darting out their tongues with lightning-like rapidity, so that without close and careful observation their true character may easily be overlooked. Toward nightfall they usually station themselves at the entrance of the hives, and with their long tongues snap up all the bees within reach. It is hard to tell how many bees it takes to make a meal, but they seem to disappear as by magic. It is therefore necessary to keep the hives mounted on stands at least eight or ten inches high, or even higher if convenient.

Mice also are enemies to the honey bee. They are especially fond of honey, and often work havoc with the bee. Mice are also particularly fond of bees and bee bread as well. Besides, a hive of combs is a splendid place for them to build their nests, consequently if they can possibly reach the combs, they are liable to do much damage in a short time. They, of course, can only harm when they get inside of the hives. We, therefore, advise that the entrances of the hives should be long and shallow in preference to round holes, not more than a half-inch high, and across the whole front of the hive. This space will give ample ventilation for the bees.—F. G. H.

WILD BEES ARE USEFUL.

The honey bee is of value to the farmer in more ways than one. It is a source of income with little labor, furnishes the table with one of the choicest sweets, and is indispensable as a pollenizer of fruit. The bees should be in a secluded spot, far enough from the house so that they will not become a nuisance instead of a pleasure. The early swarms are most profitable to keep, as they have time to fill their hives with honey to run them through the winter season, while a late swarm will have to be fed, and is usually not strong. If the summer has been a poor one for the bees, they should be fed through the winter. If they do not eat old honey, rye flour or pure candy, you can rest assured that they have plenty of honey; but if you are not positive about it, you had better place feed for them until you are satisfied they are not in need. The hives should have shelter over them, and are very convenient in the orchard, if it is not situated too far from the house to watch for swarms. White clover is the best for honey; buckwheat is valuable also.

Do not molest the bees more than is necessary to take the honey or make needful examinations. If you are keeping bees to sell honey, the pound section boxes are best and most convenient to place in the caps, as they can be taken out and the honey marketed in them just as it comes from the hive. Honey is a healthful sweet, as it is pure, and it is useful as a medicine in some cases of sickness.

Every farmer who has fruit, small or large, should keep bees. They go from tree to tree, or plant to plant, and carry pollen on their feet, thereby fertilizing the blossom and making a heavier yield of fruit than would be if no bees were kept. Even the wild bees are useful to the farmer and should be protected.

The nation's capital has the largest collection of anthropological specimens on the face of the globe. Four thousand to 5000 skulls and skeletons of human beings are here preserved. Two hundred brains are arrayed in jars. These are exhibited with those of animals for the purpose of comparison.

Let me pilot you afar
Where the redwood forests are,
And the turquoise sky leans to the turquoise sea;
Through the wondrous gate of gold
Where the poppy fields unfold,
And the mission bells call "Benedicte."

The closer money is the harder it is to get next to it.

IMPROVEMENT OF CITRUS FRUIT VARIETIES.

Continued from page 123

composition. Those who are disposed to exalt the humid-air orange for superior sweetness forget that the California orange, as compared, for instance, with the Florida product, has not less sugar, but adds to it more acid; being, in fact, not less sweet but more sour. As both sugar and acid are nutritive substances, the superiority of the California fruit from a dietary point of view is clear. Such an orange, enclosed in a thin skin of silky texture and beautiful finish, comes very close to an ideal upon which to found an industry. How well such a type of orange serves that purpose is shown by a production for 1906 estimated to have reached a selling value of twenty million dollars—the greatest value ever attained by any state or nation in the citrus line, and delivered to purchasers at a greater average distance than any other ever attempted. Far less in degree, but similar in kind has been the development of the California lemon industry; and though its greater difficulties have been by no means overcome, the advancement in the attainment of suitable varieties has secured something suitable to build upon, as already shown.

The improvement of citrus fruit varieties as diligently pursued by expert plant breeders of the United States Bureau of Plant Industry and of the southern experiment stations is of great pomological interest and promise generally. The objects aimed at are, however, of rather remote applicability to California because the conditions to which they endeavor to adapt their new fruits of citrus origin do not exist within the range of our large commercial citrus industry. They are endeavoring, by hybridization, to induce a combination of maximum hardiness with quality by which, through selection, they may attain something at least tolerable from an amateur's point of view. They wish to produce something like an orange or like a lemon which can be grown under what are now found to be non-citrus conditions. They are inviting the most startling changes of types of citrus fruits, that some departures may fall on their side. To the Californian the work is interesting. Even if they should fail to secure an orange which would bear fruit in Pennsylvania, they may produce orange blossoms and thus minister to a charming requirement even of northern people.

But although California has no need for such changes of type in citrus fruits and has, as shown, worked so diligently and long for the attainment of the types which are at present supreme in her industry, there is still ample opportunity for improvement within the types. Such improvement is to be attained, not by hybridizing, but by selection—the very effort which has opened the way for California progress hitherto. But why need this work be pursued differently now?

In the first place the citrus interest of California is too great in its commercial and cultural problems and responsibilities to serve itself pomologically as it did at its beginning. Second, the improvement of a type, removing its defects and adding to its excellences, requires closer work than to recognize the type itself and found an industry upon it. It requires the most acute perceptions of minute characters and tendencies, and most diligent search for them. It necessitates the determination of what is absolutely the best in form, substance and finish, vigor and productiveness, and the conditions under which all these are attained. It invites the closest pursuit of the best fruit as it appears in packing-house or exhibit, or as it secures special price and fame in the trade, to the trees whence it comes. Its subsequent steps are analysis, measurement, comparison, photographic and written records and study of environment including culture, and the best possible discernment of the relations of all these determinations to each other. The supreme test is propagation under various conditions to test constancy and the last resort is multiplication that the whole industry shall have the advantage of the best thing there is of its kind to plant. Incidental to the foregoing is the test of stock on which such trees are to grow; which stocks are best for this or that, or here or there, and how has it been demonstrated?

Such work will require the services of the best trained and most expert men in pomological science. They must have good eyes and clear heads, not too much cumbered with other affairs, and they must have full knowledge of why they seek and quick recognition of the signs of appearance.

It is to secure advanced work of this kind that alert and influential orange growers at Riverside appealed successfully to the legislature of 1905 for the provision of a special Citrus Experiment Station and made a tender of valuable land for it which is now being improved, for the purpose intended, by the Experiment Station of the University of California. It is designed to be the home for such important pomological work although many other cultural phases and experimental problems of orange growing will naturally be associated in its effort. Our meeting at this time is for the purpose of marking its beginning along its designated lines. It is eminently appropriate that we should assemble for this purpose in Riverside and almost upon the very spot where the first citrus fair of the pioneers marked the first great break towards the attainment of the world's high mark in commercial production of citrus fruits which now belongs to California.

THE WRONG LAY.

A school girl in a Massachuetts town had often been made to acknowledge the superiority of her brothers. One day her mother remarked upon the apparent utter lack of intelligence in a hen.

"You can't teach a hen anything," she said. "They have ruined more of the garden than a drove of cattle would. You can teach a cat, dog or pig something, but a hen—never!"

"H'm!" exclaimed the child indignantly. "I think they know just as much as roosters!"

It is the sign of the small mind to condemn what it does not understand.

Williams' Shaving Soap

DON'T go on year after year using common soap for shaving, not only taking big risks, but robbing yourself of the comfort and ease and pleasure that would be yours if you used Williams' Shaving Soap. Made just for shaving by those who have learned by 60 years' experience just how to make shaving soap right.

"The only kind that won't smart or dry on the face."

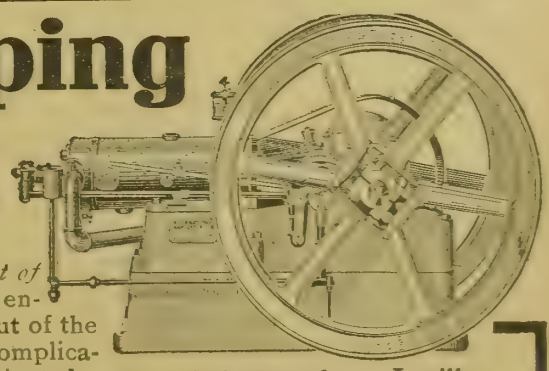
Irrigation Pumping

is done easily and economically with an

I. H. C. Gasoline Engine



WHETHER you are pumping from deep wells, shallow wells, reservoirs, canals, or running streams, an I. H. C. gasoline engine is the one best power.

It is the best for a number of reasons.

In the first place, it is *easily operated.* You don't need an engineer to look after it—in fact it requires practically no attention whatever—it will run for hours at a time, safely and regularly, and when it does needattention, your small boy or girl can look after it as well as you can.

Next it will *not get out of order.* I.H.C. gasoline engines are made throughout of the best materials, and all complicated parts have been eliminated.

And again, it is economical.

Ordinary stove gasoline is the fuel it uses, and it gets all the power out of it and wastes no fuel. And gasoline is something you can always have ready. Buy it by the barrel, and it is easy to keep a supply on hand.

And there are many other features which we can't go on to explain here—durability, safety, convenience, etc. Investigate them before you buy. It will pay you to know all about them.

I. H. C. gasoline engines are made in various styles,—Vertical and Horizontal, Stationary and Portable, and in sizes ranging from 2 to 20-horse power. When not in use for pumping they furnish excellent power for sawing wood, cleaning grain, grinding feed, shredding fodder, separating cream, etc.

CULTIVATOR APPRECIATED.

This issue of the Cultivator contains 810 inches of advertising matter, the largest number of inches of advertising the paper has ever carried in a single issue. The increased space compels an enlarged paper, to accommodate the usual run of departments, editorials and miscellaneous reading.

The value of the Cultivator as a medium for advertising results is now apparent. Advertisers get results and that is the test of value. To instance a case; a single article on the "New Muskmelon," recently brought 200 letters of inquiry to this office, and the seed house handling the melon seeds. In a smaller proportion are letters of inquiry relating to poultry, stock, farm implements, and agricultural questions. The Cultivator is simply getting its feet planted on the Pacific Coast. It's future is assured. It's field of usefulness is just opening.

PROSPEROUS YEAR AHEAD.

Whatever inconvenience we may suffer personally, from the rain and storms of the present month we are consoled in the knowledge that great prosperity lies before us as a state.

We are assured already of enough moisture to grow our crops, or to secure them, and we know too, that additional moisture will be added, the ground being now in better condition to drink in the rains to great depth than at any time in the last few years.

Comparatively little rain so far has run off, so far nearly the entire 12 inches having gone into the ground. The snows on the mountains have been heavier this season that for many past, even coursing down to the bottom of hills many places, so that we may have no fear for water in the bottoms and valleys for a long time to come.

As water is king in California, we should not Complain if the "king" bestows his blessings upon us in super-abundance. When the Owens river sends down its cohorts to reinforce natures' supply of water what a grand country we shall have. No fear then of lack of water anywhere in Southern California, and as Northern California never goes dry, and Central California seldom ever, we can sit back and wait the coming of the world to our gates with perfect impunity.

We are sending out, and shall send out over 27,000 carloads of the largest, finest—oranges over raised in California. There will return to the growers in the state, north and south, over $20,000,000 and this sum reinforced by the output from the vegetable and small fruit products will work a record-breaking year of prosperity for California.

The Cultivator will prosper with the farmer for it is his advisor and friend, and as he prospers so shall we all prosper for on the success of the individual must the success of the community and the State depend.

Now let the railroads get ready to handle the business of California, keep fruit and vegetable trains moving and all will be well with our favored state.

CENTRAL CITRUS BELT.

The Cultivator would advise the citrus growers of the Porterville-Lindsay district to arrange with the University authorities for a citrus institute, at which shall be discussed the varied phases of orange culture such as soil, planting, pruning, irrigation, fertilization, fumigation and care of the fruit. The time is not far away when the Central Citrus belt of the State will rival Southern California in quality and quantity of production. To understand properly, on the threshold of the undertaking, the scope of the business will prove of the most vital importance to the orchardists. It will give him in condensed form the education it has taken veteran growers years to acquire.

ARBOR DAY.

The annual return of Arbor Day emphasizes the importance of a general awakening of public interest along the line of tree-planting.

The State of California needs more forests. Hundreds of thousands of trees should be set out every season along the streets, the country highways and the foothills, extending well up the hillsides until they are covered.

The value of forest trees as water sheds needs no argument. All the authorities are a unit on the proposition. Not only will they conserve moisture, but tend to equalize temperature, making the summer pleasanter and the winter milder in tempering the winds.

Our forests have rapidly been cut away and burned away the past few years and no attempt has been made in a systematic manner to replace them. At the rate they have been denuded it will only be a few years until the State will be practically without shade trees, except in the towns. So we ought to be replanting, in every section of California, to the end that not only beauty in scenery may be preserved, but our water conservators enlarged.

The Cultivator trusts that every Improvement Association in the State may make an effort to celebrate Arbor Day in a fitting and practical manner.

SOUTHERN CALIFORNIA STATION.

Prof. Ralph E. Smith writing on the above topic to the Cultivator, in support of branch experiment stations, says:

"The horticultural problems of Southern California are most peculiar, those of no other section of the world being the same. They cannot be met by simple demonstration or rehearsing of facts learned in other places, or by the advice of one who has learned his facts elsewhere, however great his experience. The greatest problems, the greatest obstacles of horticulture in Southern California today are those that can be successfully met only by local, intensive, closely applied investigation of a permanently established nature.

The promoters of the Southern Branch Station attempted, conservatively and with wisdom, to provide for this need by establishing facilities in the southern part of the State which would allow the State Experiment Station at the Universiy of California to develop and improve it's activities in that section. They conceived the particular needs of their region to be, as a beginning, investigation in Plant Pathology, and in the various features of cultural practice such as affect the quality, quantity and commercial value of crops. In this their effort was well directed and their judgment good, since in these lines especially is thorough, competent and continuous investigation needed in Southern California."

Discussing the location selected by the commission for it's Exepriment Station, Prof. Smith says:

"The most important practical consideration in connection with this "Citrus Culture Station," is naturally, what is to be done with it; what will be it's lines of work; it's objects, and it's methods? This can be answered only briefly in this place. The object of the station will be to assist in the general improvement of the citrus industry in every possible way, with the hope of maintaining an increasing production of better fruit. The keynote of success in this industry is quality. Quantity in itself has it's limitations in bringing success, but there is no limit to the profitable production of quantity or quality. The production of high-grade fruit has many factors. Some of these are well understood and in general practice, others are partially so, and still others are yet to be demonstrated. The work of the Citrus Experiment Station must necessarily be slow, patient, and barren of many striking, brilliant results. The public should appreciate this and not become impatient so long as the work is prosecuted vigorously, intelligently, and with well judged objects and competent methods."

Prof. Smith writes a good deal more in detail concerning the work of the Citrus Experiment Station and makes the point very clear that the location of the station was primarily made to reach conditions existing in Southern California.

DR. HILGARD'S "SOILS."

As a fitting climax to his long and valuable services to agriculture comes Dr. E. W. Hilgard's "Soils: Their formation, properties, composition and relations to climate and plant growth in the humid and arid regions." For lack of time we have been unable to take more than a glance through this monumental work and later we will give an extended review. Those who have had time to thoroughly digest the book are loud in their praises, pronouncing it superior to anything yet published on the subject.

UNIVERSITY REPORT.

President Wheeler, in the Biennial report of the University of California, shows the loss the institution received by reason of the San Francisco disaster. In general, the loss reaches $83,800 in repairs, restorations and income.

"The farmer's trade is one of worth,
He's partner with the sky and earth,
He's partner with the sun and rain,
And no man loses by his gain.
And men may rise and men may fall,
The farmer he must feed them all."

The country prospers in porportion as the farmer prospers. The success of the farmer insures the success of the country.

News of Country Life in the Golden West

Southern California

AGRICULTURE.

The rainfall to date at Riverside is 10.90.

Chino has received 18.74 inches of rain.

The large new creamery at Imperial is ready for business.

Five firms will together plant above 400 acres of grain in the Yucaipe.

The rainfall at Santa Paula is 18.95 for the season, against 4.87 for last season.

The season's rain-fall in Pomona amounts to 18.71 inches—almost nineteen inches.

The Glendora Farmers' Club will hold its regular meeting on Saturday, February 9th.

The fall for the last storm at Redlands amounted to .83 of an inch, mak- 14.32 inches for the season.

Dealers are now paying $10 and 11 per ton for hay the same price that prevailed through the summer and fall.

The rainfall of Tuesday and Wednesday amounted to .85 inches at San Jacinto bringing the total for the season up to 12.45 inches.

Grain seeding, in progress in the Yucaipe valley during the past 12 days has been the liveliest ever in the history of that section.

Several cantaloupe growers in the vicinity of Brawley are already planting seed, believing that they are going to have an unusually early season.

The ranchmen of the Coachella and Thermal districts are busily engaged in arranging for shook to make crates for shipping their onions and cabbage.

The rain man yesterday added more than half an inch to the San Bernardino valley's record bringing the total for the season up to 15.93, or practically 16 inches.

The people of Lemon have contracted with a Los Angeles cannery for the shipping of tomatoes. Nearly 200 acres have been signed for at a higher price than last year's contract.

The cabbage growers held a meeting at Coachella and while no positive arrangements were made, we understand that the California Vegetable Union will handle the crop.

Every possible precaution is being taken by the desert melon growers to guard against the aphis, from which the crop suffered considerable damage the latter part of the season last year.

The continued heavy rains are going to make the price of hay high this year, according to Redlands dealers. They assert that it has put planting so far back that the old crop will be entirely exhausted before the new comes on.

A number of Coachella ranchers are already breaking ground for the melon crop. While no accurate figures are obtainable as to the number of acres for this year, it is expected that a larger acreage than last year will be planted.

The Brawley Cantaloupe Growers' Association has over 600 acres of cantaloupes signed, and expect to have from 100 to 200 acres additional. It also has about 25 acres of tomatoes and several acres of cucumbers pledged.

All the lands of the Southern Pacific included in the government grant to the Central Pacific in this State, Nevada and Utah, with the exception of the timber property, will be placed on sale not later than July 1 this year.

The chief damage to the celery crop was produced by the overflow of the fields, where the waters rise high enough in the trenches to run over the tops of the banked plants. Where this happens there is danger of rotting at the tops of the plants and of "black heart."

It may be the Salton sea or it may be the tons of dynamite which are being fired daily that is causing the increased rainfall. Be that as it may the fact remains that the desert is experiencing a radical change in climatic conditions, a most unusual amount of rain falling this winter.

HORTICULTURE.

Rialto shipped three cars of oranges on the 1st.

Highland has shipped 170 cars of oranges to date.

There is a scarcity of citrus nursery stock all over Southern California.

Riverside has asked that March 1st be set aside as a national Orange Day.

The total planting of grapes about Imperial this year will probably reach 1500 acres.

Shay & Dairs are setting out 20 acres to berries and rhubarb at San Bernardino.

Orange county nurseries are practically exhausted of orange and lemon trees as are most other sections.

A message from Rialto says: "There will be but few oranges picked until the market becomes more favorable."

Car load after car load of grape cuttings are being brought in and planted in different portions of the desert.

The demand for orange trees for planting is unprecedented in this section, in fact, the demand is six times as great as the supply.—San Bernardino Sun.

The Azusa Foothill Citrus Company has increased its packinghouse floor space by about 25 per cent and doubled its capacity for handling and packing oranges.

If there were 2,000,000 more orange trees to be had in the south they would be snapped up quickly. Lemon trees are also in great demand, while the supply is limited.

The Orange County Horticultural Commissioners declare that no damage was done to the citrus fruit by the heavy frosts the first three days in December.

The Riverside Horticultural commissioners say that while the frosts were extraordinarily heavy the large quantity of moisture in the ground saved the fruit and trees from damage.

The Orange County Horticultural Commissioners will withdraw the county citrus-fruit fumigating outfits from service in the coming spring. Private parties have the field filled.

It has been proposed to send out parties of school children, say a hundred at a time, into the foothills around San Bernardino, on Saturdays during the coming months, each child to plant a tree.

W. W. Perkins of El Modena is digging roses for shipment East. This process is not done as might be supposed by spades but by plowing. "Cutting" is the proper term used. Mr. Perkins will pack the car at Orange. He has a force of twenty-five men helping him.

The new Tulare county ordinance prohibits the importing of all rooted vines into this county which are found to be infected with Anaheim, phylloxera or other diseases. The ordinance also gives power to the horticultural commissioners to destroy all parts of the shipments found to be affected.

The orange crop is fully as large as that of last year, but a considerable portion will be lost if warm weather continues, which will cause oranges to puff. The fruit runs the largest of any for many years, and is excellent in quality. At present, however, the market is shaky.

The Ojai olive crop is not a very heavy paying proposition this year. The fruit was sold to the American Olive Company on the trees. That company sent a crew of pickers to Nordhoff about three weeks ago; and on account of the rains, they are still here; and the crop, estimated at twenty-five tons, is not all picked.—The Ojai.

The first company organized for the manufacture of denaturized alcohol in San Bernardino county filed articles of incorporation with the county clerk this afternoon. The company's title is the California Vineyard & Improvement company, and the purpose of the organization is the manufacture of grape juice and denatured alcohol.

Northern California

AGRICULTURE.

There are 40,000 tons of beets about Salinas unharvested.

Hay is now at a premium as well as wood and coal. On the bay they are paying almost any price for any kind of hay.

Yolo county farmers in anticipation of the erection of a sugar factory, have pledged over 300 acres to the planting of sugar beets.

The stockholders of Tulare Coöperative Creamery Company held their annual meeting Friday afternoon, in the City Hall at Tulare, to hear reports and elect their board of directors.

At a meeting of the Board of Directors of the State Agricultural Society held on Saturday, January 12th, it was decided to hold the next State Fair from the 7th to the 14th fo September, inclusive.

The River and Harbor Bill carrying an appropriation of $50,000 for the Sacramento River, constructing jetties, dredging, etc., to improve the navigability of the stream, has been passed at Washington.

The Irrigated Land Company has purchased 1302 acres of choice land adjoining the town of Gridley. The land will be divided into small tracts, and there are already purchasers on the ground to occupy it.

A force of seven United States livestock inspectors, who are connected with the Bureau of Animal Industry, arrived in Red Bluff Saturday for the purpose of making a general survey of sheep conditions in the county.

Among the interesting subjects discussed at the Wheatland farmer's institute may be mentioned, "Summer Fallowing, Farm Wastes, Alfalfa culture, the Dairy Herd, Orchard Topics, Will Pumping for Irrigation pay?"

It is in all probability likely that at the meeting of Sonoma County Pomona Grange in this city on February 16, that Prof. Wickson of the University will deliver one of his popular lecture.—Healdsburg Enterprise.

Senator Boyton's bill asks for an appropriation of $200,000 or more for the erection of buildings, improvements, purchase of furniture, supplies, machinery and live stock, and for paying the operating expenses of the University Farm at Davisville

J. C. Henshaw, who is operating the Drake ranch on Sandy Gulch near Chico, has after careful examination become convinced that rice can be successfully cultivated in this county, provided that sufficient acreage can be secured to justify the required irrigation.

The American Beet Sugar Company grows at Chino about 1000 acres of beets for itself. Other farmers grow here 600 to 800 acres; the remainer of the immense consumption of near 100,00 tons of beets is grown elsewhere—chiefly near the sea. Although about 10,000 acres of beets are grown for the factory here.

We understand that several of the orchardists in the vicinity of Tulare, are preparing to plant peach trees this season. One year with another, the peach has proven a good money-maker, even orchards on low ground where frost occasionally does considerable damage to the crop having been profitable.

United States Attorney Devlin has received information that the railroad companies of Northern California have been keeping cattle on cars without food or water for fifty-six hours. As soon as sufficient evidence has been collected, civil suits will be instituted. The longest period that cattle can be kept on cars is thirty-six hours.

The situation of the beet growers in the Salinas valley who had not got their crops delivered was growing much better last week, and hauling to the factory would have begun again on Monday had not the last three-quarters of an inch of rain made all the roads tributary to the main roads wholly impassable and the fields again bogs of mire.

HORTICULTURE.

Total rain to date at Visalia is 9.34. At this date last year it had rained 5.96.

Exter to date has had 9.66 inches of rain, but points nearer the foothills have received more.

The rainfall in San Lucas to date is 13.36 inches, which is more than double the amount of last season at same date.

The Petaluma county fair, planned for August of the present year, will lay over anything seen in that line for many years.

A large party of legislators visited the Kearney estate at Fresno, on the 2nd, to see what this fine gift to the State consisted of.

C. C. Donovan of Healdsburg, has purchased one hundred and twenty-five bales of hops. The grower receiving 11½ cents for his crop.

The citrus fair under the auspices of the Cloverdale Co-operative Citrus Association, will open in Cloverdale Tuesday evening, February 19.

During the few days last past three carloads of apples have been shipped from Watsonville. The total shipments for the season to date amount to 1793.

The output of butter at the Watsonville creamery at the present time amounts to about 350 pounds daily, but a material increase is expected when weather conditions improve.

The highest amount per acre realized by an orchardist in Solano county, is in the case of Louis Oberti, who runs a cherry orchard of three acres, near Suisun. The sales from this three-acre orchard netted $3000, being $1000 per acre.

At this writing rain in unusual quantities is falling quite generally over Northern California, and all reports in these columns will receive a considerable addition. In many sections all rain records to date will have been broken.

A large tract of land in Siskiyou and Shasta counties, sold by the Five States Lumber company and W. E. McCord, comprises 10,000 acres and lies on both sides of the county line east of the Sacramento river in the vicinity of Castle Crag and Dunsmuir.

Over an inch of rain fell in Redding during the twenty-four hours ending at 7 o'clock Monday morning. The exact precipitation was 1.09 inches. This brings the season's precipitation up to 19.21 inches, as compared with 15.23 inches at an even date last season.

A dispatch from Sonoma on February 3rd says: The rainfall here the past twenty-four hours was unprecedented. The precipitation last night was three inches. Sonoma Creek and all its tributaries broke over their bank and inundated all the extreme southern part of the valley.

The committee on fruit and vine interests in the State Legislature recommended the passage of Senator Black's bill making it a misdemeanor punishable by a fine of $50 to $500 to sell trees under false names. The proposed law is intended to prohibit fraud and misrepresentation in the sale of fruit trees. Prosecution may begin any time within five years.

The largest cherry orchard in Solano county is that of Fred J. Jones, in Green valley. The orchard comprises 152 acres, 125 of which are in cherries, twenty-one acres in peaches and six in almonds. Of the 125 acres in cherries, thirty acres are in bearing, comprising several varieties. The gross sale from cherries grown on this thirty acres last year amounted to $27,000.

Potato dealers in Stockton say that is would not suprise them if the price of spuds per sack on the bank would reach the $3 mark within the very near future. Owing to the congested condition of transportation the arrivals from Oregon and Eastern markets are very light and the local growers in the absence of foreign shipments are practically in a position to dictate the terms.

FEEDING LAYING HENS.

THE FOLLOWING thoughtful and suggestive letter from a subscriber calls for more than a passing answer, for the consideration of it may help many.

"Dear Madam:—The dry feeding formula as given out by the Maine Experiment Station includes one-seventh of gluten meal, and one-seventh of linseed meal.

"Taking our climate into account, do these not form a too fattening proportion of food for fowls, especially for the American breeds in confined spaces?

"Would it be a matter of interest to your readers if you could kindly elicit from reliable breeders, the monthly returns during the course of one year, of eggs laid by each of the leading varieties of poultry? Say from a pen of so many birds, stating age and variety, etc., quality and quantity of food supplied, etc."

In the October numbers of the Cultivator there was a synopsis of the experiments of the Maine Experiment Station with laying hens, experiments in selecting by means of trap nests, and experiments in feeding for producing eggs. These experiments are both interesting and instructive, and in the bulletin referred to by our correspondent, we learn hod they feed the young chicks (on dry food;) how they select and feed the pullets; how they trap-nest them and choose only the best layers for their breeders; and how they finally have succeeded in getting a marvelous increase in the number of eggs laid.

The formula to which our subscriber refers is the dry feed, which is kept always before the fowls in a feed trough with slatted front.

This dry meal mixture is composed of the following:—200 pounds of good wheat bran; 100 pounds of corn meal; 100 pounds of middlings; 100 pounds gluten meal—or brewer's grain; 100 pounds linseed meal, and 100 pounds beef scraps.

These materials are spread on the floor in layers one above another and shoveled together until thoroughly mixed, then kept in stock. The trough is never allowed to remain empty; the dry meal mixture is constantly within reach of all the birds and they help themselves at will.

Health of Fowl.

When I am asked questions about fowls, their health, etc., I usually interrogate Nature to find a suitable reply. When a question comes about feeding or the value of foods, not being an analyst myself, I interrogate Prof. Jaffa, or rather refer to his bulletin 164 on poultry foods. I find by this that the Maine formula has a nutritive ratio of about 1:4.6. I think our subscriber is quite correct in suggesting that this is too wide a ration for this climate, especially for Plymouth Rocks, and that by omitting both the gluten meal and the linseed meal, he would have a much better ration for this warmer climate. This omission would give a ratio of 1:3.9, which would be a very satisfactory ration for Rocks. In the matter of feeding of the different breeds, there is a good deal to be considered. The lighter and more active breeds, such as the Leghorns, require a more heat-giving food; a food that will supply them with the heat and energy necessary to their active habits; and by having this wider ration, they will be enabled to lay more eggs and do better than if kept on a less carbonaceous diet. The Rocks and Wyandottes, on the contrary, if fed the more fattening or narrower ration, instead of growing more active, putting on more energy in the way of laying eggs, turn it into fat, consequently they demand a narrower ration. In other words, less fattening food and more protein; less corn, gluten meal or linseed meal or any fattening meals, and more meat. This is really the only difference between the wide and narrow ration. The narrow has more meat, the wide more corn or fattening food.

Roughness.

There is one thing that some breeders over look, and that is the necessity of supplying a certain amount of "roughness" in the food. Farmers understand that their cows and their horses need this roughness and give it to them in the shape of hay, or other coarse fodder. With fowls we find that the best roughness is green food, alfalfa hay, or even straw, if nothing better can be had. There is a certain amount of fiber in the grains, but it is not sufficient to supply the necessary roughness, or filling food. This latter is by far the least expensive and it is therefore extravagant and unwise of the farmer not to supply this need. It is surprising how much hay or straw, out of the scratching pen, the hen will eat. I found mine required at least a leaf of hay every week in their pen. This they scratched and broke into small pieces and ate it, although they had plenty of grain ground fine, or scattered in the straw always before them; they seem to understand the need of this roughness. While the Maine Experiment Station's formula is excellent, as the results prove, in the Maine climate, I think, with our subscriber, that a better formula can be made for our own climatic conditions from the grains, mill stuffs and by-products of California as given in Prof. Jaffa's very valuable bulletin, (Farmers bulletin, 164) on Poultry feeding. This contains an analysis of all of the Pacific Coast foods and of the proprietary foods in common use here, and by studying this analysis and the eight formulas given foods can be so mixed as to give a properly balanced ration of the cheapest local raw materials.

Study Feeding.

By studying poultry feeding, in fact the whole poultry business, as you would any other enterprise in which you risk time and money it can be made profitable. I think it might be both interesting and profitable to our readers if some of the reliable poultry breeders would give us their monthly returns of eggs laid by each of the leading varieties of poultry.

Last week I visited some poultry ranches near Los Angeles, and found on one that every egg that had been laid during the last three years had been carefully counted and a perfectly systematic record kept of the expenses, losses, gains, eggs and chickens sold and the different prices received each year or season. Such a system of bookkeeping showed careful thought and study, and consequently success in the poultry business. These friends of mine (a professional man, wife and two sons) came as novices in the business, bought a farm,

or rather 20 acres of land, built a house and chicken coops, started into the business. From the first they have made a success of it, by sheer hard work and study. It is a business of ups and downs and in order to be successful one must stick to it unmindful of discouragements. This they did, and though greatly discouraged, one year by roup which attacked their flock, they have, by proper housing, (they use the mushroom houses) and perfect ventilatation, feeding clean grain and properly balaneed ration, overcome all their troubles and are now prosperous poultry breeders, with a ready sale for all their products. Truly it would be hard to find any occupation offering more inducements for the amount of money invested, than the poultry business if rightly conducted.

CHICKEN HATCHING.

The incubator plays a most useful part nowadays in the hatching of chickens, but by far the greater number, after all is said and done, chip their shells through the good offices of mother hens. For those who prefer the old method, and particularly those who are just thinking of starting to keep poultry, the following remarks may be useful, and there is plenty of

Single Comb Brown Leghorns

time to study them, and so be prepared, before next hatching season.

To hatch the largest possible number of chickens from any setting, follow natural methods as closely as possible. When a hen sets herself away in some sheltered corner, and is not interfered with further than providing her with a sufficient supply of food, she usually hatches every fertile egg, or almost every one. An examination of the nest she has made for herself—say among the long grass, under the shelter of a hedge, and its surroundings—will convey much information as to how the artifical article should be got up.

How many eggs should be given to a hen to hatch? It depends upon the size of the hen, the size of the eggs, and also upon the season of the year. In the very early part of the year, when winter is severe, it is always better to give her a moderate number of eggs, so that she will be able to cover and protect all the chickens nicely which she may hatch. Nine chickens are about enough for a hen to do full justice to during cold weather—that is, if she is a hen of good size; a small bird will do better with rather less. As the season advances she may have a dozen or thirteen, if she can manage to bring as many out of the eggs given her.

It is very desirable to get a hen with keen setting propensities, when her incubating offices are required, particulary if she has to be brought from a distance. The latter condition often upsets the broody instinct of many birds, the strangeness of the new surroundings making her forget everything else. It is very provoking to find that a hen has left her nest after being intrusted with valuable eggs. These are mostly birds with a certain proportion of non-setting blood in them, such as half-bred Minorcas, Leghorns, Anconas, etc. Since the Buff Orpington became fashionable, good seters in the early part of the year have not been so scarce, and such birds, when they once go broody, can usually be depended upon to do their duty throughout. Buff Orpingtons crossed with any other setting breed are also excellent, and the same may be said of Black Orpingtons, Plymouth Rocks, Wyandottes, Indian Game and Dorkings, either pure or crossed with each other, are also very reliable.

LEGHORNS VS. MONGRELS.

The West Virginia Experiment Station reports the following summary of an interesting experiment:

Fifty White Leghorns were compared with fifty mongrels for one year as to the cost of food and egg production, ordinary care and attention being given them, such as they would receive on the average farm.

In addition to skim milk used to moisten the mash, the Leghorns consumed 61 pounds of food, costing 85.3 cents, and the mongrels consumed 66.8 pounds of the same materials, costing 92.1 cents.

During the year the Leghorns laid 116.5 eggs, worth $2.24 per hen, and the mongrels 96.1 eggs, worth $1.78 per hen.

The Leghorns gave a profit over the cost of food of $1.39, and the mongrels a profit of 68 cents.

The mongrels gained in weight one pound per head more than the Leghorns. If this increase in weight is taken into consideration, then the Leghorns gave a profit of forty cents per hen more than the mongrels.

The highest prices for fresh eggs usually prevail during the months of November, December, January and February. During these four months the mongrels laid only 364 eggs, and the Leghorns 1029, or practically three times as many.

In nine cases out of ten failures in the poultry business is due to carelessness on the part of the care-takers. How many people neglect giving their fowls sufficient water have no regular hours for feeding, and keep them starving for hours in the morning, especially if the weather is stormy. Yet they expect the hens to lay the same as if they were well taken care of.

Scientists believe that the Eiffel Tower, Paris acts as a lightning rod to protect the city.

When writing advertisers mention Cultivator

WINTER MANAGEMENT.

Fowls that do not lay well in the winter and that are fed considerable fattening food are very apt to become over fat. Fowls that are too fat lay but few eggs because they accumulate an excess of internal fat. It increases often to the point of causing the hens to drop from the roost at night dead from apoplexy. The way to prevent this is to feed only small grain, and keep them continually busy hunting and digging for their grain food. This gives them plenty of exercise, helps to use up in energy the surplus food that might otherwise be turned into fat, and the continued exercise lends its influence and increases the egg yield. A proper grain ration, properly fed so as to continue the daily hard work in digging and scratching as exercise, has quite as much to do in the egg production as has any other one condition in the caring for poultry.

The hens that are likely to produce a profitable egg yield during the winter months should be in prime condition for laying by the first of December. Hens and pullets that are not in good laying condition by that time are not likely to be of much service for several months in egg production. If cold strikes the hen that has not finished her moult and gained a healthful, vigorous condition, the demands of her system will use up about all that there will be of advantage in the food that is given her, leaving but little to be turned into the formation of eggs. For this reason we have continually advised that manner of care for poultry which will bring them into the best possible condition for egg production before winter sets in. The hen is like the cow—she can only do the best work when in the best possible condition for doing that which is demanded of her. An ill-fed, poorly cared for cow seldom pays expenses during winter at the pail, nor will a bad-conditioned hen give profitable returns at the egg-basket.

WHITE WYANDOTTE FARM.

The Cultivator is in receipt of a handsome booklet on White Wyandottes, issued by the White Wyandotte Farm, Inglewood. The book is printed on sepia paper, handsomely illustrated with half-tones, made direct from photos of their birds, houses and yards. In their yards are about 3000 birds, and they claim the most perfectly appointed poultry plant in California.

The founder, Anna L. Pinkerton, has been a breeder og Wyandottes for years, and her wide experience will serve her well in selecting and mating birds for her customers. The booklet will be sent free on application to readers of the Cultivator.

The Southern Pacific passenger department has just issued a little booklet entitled "California South of the Tehachepi." It contains many valuable and interesting reviews of the country written up, and is illustrated with half-tone views of almost every town included in the territory. It is very valuable as a guide to send East to friends. A copy may be obtained by writing Charles S. Fee, general passenger agent, San Francisco.

Special attention is called to the advertisment of the Principal Incubato Company, Graton, Sonoma County, California. The company make the claim that they are the "best on earth," and in any event it will pay intending purchasers to write them for their price list, and for any other information desired. This company are manufactures of not only incubators, but also brooders and dealers in poultry supplies and fixtures. They are building up a large business.

Piles Cured In 6 To 14 Days.

Health and Rapid Growth in Baby Chicks

GRANULATED MILK—the Pure Protein Food

315 S. Main **HENRY ALBERS CO.** Los Angeles

FAILURE

EGG FOOD — A·C·W — IT FILLS THE BILL

to raise a large healthy flock of poultry lies in the care and food the chicks get in their early days. 75 per cent. of the death los in chicks comes from improper food. By actual experiments we found a combination of chick food that is so made that the young est and weakest chicks can eat and thrive on it. No BOWEL TROUBLE caused by indigestion and irritation of the immature organs if you feed A. C. W. Chick Food. Test this statement by using a sack; for sale at dealers. We have been in business here 14 years and deal in Poultry Food—not HOT AIR.

FATTENING FOWLS FOR MARKET.

In fattening fowls on the farm for market the first thing to be considered is the place of confinement. The coops, if but a few are to be fattened, should be about 2 feet high, 1½ feet wide and as long as desired, divided into apartments holding 10 to 12 fowls. Or a corncrib can be used, if closed about 2 feet from the floor so that those inside can not see out and be disturbed by the fowls outside into a restlessness not conducive to rapid fattening.

When large numbers are to be fattened at one time coops are not practicable and the birds should be placed in small yards and kept as quiet as possible. This will necessitate those of the same flock and age being together so that fighting will be eliminated.

Do not attempt to fatten a diseased fowl, for the rest of the birds may become similarly affected. Look out for roup and indigestion. Be sure that the fowls are not lousy. Better dust with some good insecticide at the beginning of the process, for no bird can thrive and fatten rapidly if thus infected.

After the fowls are shut up begin to give the extra food gradually. If overfed at the start they "get off their feed," and every close observing, progressive farmer knows that it takes days for other farm animals to overcome such a difficulty, and it is the same with poultry.

The English, while giving us much credit for the number of eggs we produce, criticize the quality of the eggs and of the fowls that we call fat. This they attribute to our lack of knowledge of how to feed and fatten scientifically. They say our methods cause a layer of fat just under the skin, which is not desirable, for it cooks away and is useless. The proper method of feeding so incorporates the fat with the flesh that it makes an exceedingly palatable dish, juicy and tender instead of stringy and oily.

It is said that birds do not fatten so well if confined separately—except when the cramming process is used as they are apt to pine and mope, but being of greedy dispositions when they see others eating they instinctively hustle for their share. This proves a healthful stimulant to the appetite and more is eaten than wiuld be the case if each were penned alone.

Many formulas are given as to the amount and kind of food to be used, but here again good judgment and common sense are to be exercised, for locality, climate, breed, and prices of available food stuff must all be taken into consideration. And the knowledge of the relative values of food is quite indispensable. In our northern States corn is usually the cheapest fat-making food, so the more of it the fowls can be induced to eat the better. Two of the three meals each day should be corn meal mixed with milk and seasoned with a little salt. The noon meal may consist of whole corn and wheat with green vegetables and meat. The corn should be shelled and all of the food fed in troughs so that they will exercise as little as possible in obtaining it. Clean water sharp, gritty gravel and charcoal should be kept by them all the time.

In no case should food always be kept by them, but every fowl should have time and chance to eat his portion. After the first few days they should have all they will eat up clean in a short time, say an half hour.

Fowls will continue to improve just as long as they eat with a relish and this is usually about 3 weeks. Skillful feeders may sometimes shorten this process a little.

Another ration sometimes used, and claimed by those who use it to be the best yet is this: 100 pounds each of wheat bran, wheat middlings, buckwheat middlings and corn meal, and 10 pounds of powdered charcoal. If buckwheat is not obtainable twice the number of pounds of oatmeal from which the hulls have been sifted may be used, or ¾ the number of pounds of gluten meal may be substituted.

This should be well mixed while dry and at each mealtime enough for a feed should be stirred into a rather stiff batter with skim milk. If you haven't milk use 50 pounds of beef scraps in the mixture and stir up with water. If the milk is not sour allow the batter to ferment, but not become too sour. As fermentation is the first process of digestion this lessens the work of the digestive organs and more food can be consumed, thus shortening the fattening period. With this ration, grit, green food, charcoal and fresh water must not be omitted.

A mistake most farmers make is that of selling their poultry before fattening. Thin, scrawny birds of mixed breeds or of no breed at all never bring the top market price, whether sold alive or dressed.

MRS. CORA N. PORTER. (Iowa.)

STUNTED FOWLS.

It is held by many poultry raisers that fowls that are incubated as early as the latter part of June or the first of July never mature and make large vigorous fowls if permitted to remain out on range with the early broods. The results will be improved but very little if they are housed with fowls of all ages. If you are positive that you can give the latter broods attention at the first appearance of frost and continue to administer to their requirements throughout the winter late incubations wil pay, but not as large a profit as will the early broods, because the early broods are grown under natural while the late broods must be grown under artificial conditions. In my opinion those that incidentally have late chicks by reason of the hen stealing the nest or otherwise would find it safer to send them to market rather than to attempt to carry them over. Not one farmer in a hunderd ever meets with success in trying to raise late hatched chicks. Not because he hasn't sense enough, but because he already has a multitude of things on hand without looking after the wants of late chicks. In former years the farmer had some leisure moments in the fall, but of late it seems as if the fall is the busiest season of the year for him. Hence he who complains of stunted chicks can best be relieved by disposing of them early on the markets. It is a fact that we are living in the land of changes. If it were once profitable to the average farmer to raise late chicks, it is not so now. Those who do not conform to the times in which he lives will always be "lagging behind." No matter what his calling may be, every wide-awake American should study for improvement.

Save Your Fruit From Frost

Be ready to meet the first cold snap and protect citrus fruit and vegetables from frost. You can be protected by using **Geo. Griffiths' Heat and Smudge Fuel** (patented). Not only crops saved but trees kept from injury. Others did it last year, you can do it this.

One grower saved thousands of dollars by using this fuel, while neighbors who did not use it lost crop and had trees badly injured. One ton per acre will answer for three nights' burning.

Order now and have fuel on ground for immediate use, if needed. Loose fuel in sacks $9 per ton f. o. b. Los Angeles; Briquettes, $12. Stoves good for 8 years, 50c each. No oil or kindling needed.

George Griffiths
1037 S. Broadway Los Angeles, Cal.

Egg Producers

Wright's Strain of Black Langshans

are acknowledged to be the best. At the last San Diego show twelve of our birds had an average score of 93 7-12, by Browning, an Eastern judge, winning five first, three second, and four special prizes. Among the latter was the Harry McIntire Asiatic Cup for best trio. No better egg-producing fowls known than my strain of Black Langshans. A few fine cockerels for sale $5.00 and up. Eggs $2.00 per 13. For particulars, circulars, etc., address

Queries and Replies

Olives and Apricots.

Will you kindly tell me if growing olive trees from seed is preferable to growing them from cuttings? Should the pits be cracked before planting? At what season should they be planted and how deep should they be covered with earth?

Do peach trees budded on almond or on Myrobolan plum roots produce the same quality of fruit as when grown on peach root?

I have a number of eight-year-old apricot trees, thrifty and handsome to look at, but not one of them has ever, to my knowledge, produced an apricot. They always blossom moderately, but never set any fruit. I do not know the variety. Could you suggest any reason why they do not bear? They are on very good soil and since I have had the place (for the last three years) they have had careful pruning and attention.—J. B. M., Corning.

You cannot grow olives to advantage from seeds, they will not come true to the parent. You may grow seedling and bud or graft them, but the process is too slow.

Trees from cuttings come into bearing much sooner. Olive pits should be bedded down as soon as taken from the olive; plant them about an inch deep.

Peach trees or almond roots have a bad reputation in Southern California. They do not bear well. On plum roots, the trees are inferior. Peach root is the best and it pays to use it, even if you lose a year.

Your apricots must be Moorpark or some of the non-bearing varieties. There are a number of varieties that are fine to eat, but are absolutely barren in some places. Cut off the tops in July and bud the sprouts to some good variety or some good shipping plum like Wickson.—J. W. M.

Walnuts.

I have some 25 acres suitable for walnuts. Black sandy loam ten to twelve feet to water. Has been in alfalfa for twenty years; get from six to eight tons per acre per year.

Can irrigate from river five or six months during the year and do irrigate with flood water every year so no manure is needed. Feed to cows. I am realizing something like $100 per acre per year (gross.)

This land is nine miles from Escondido, thirty-five miles from San Diego; thirty from Ocean—to be plain, is in San Pasqual, and is 10 days or two weeks earlier than anything in county outside Imperial

This land is also suitable for berries.

Now I would like your advice. Would it be berries after awhile and alfalfa in mean time, or would you put in walnuts.—R. T., Escondido.

If walnuts have not been proven in your vicinity we would not advise planting largely, and it is quite likely that with land such as you have, a berry crop will bring more net revenue per acre, providing of course, that you have enough. If you have land and locality that will produce strawberries all winter you will find these to be an exceedingly profitable crop.

There will be a Farmers Institute held in Escondido in April next which you should attend, as the questions of soils and the crops most suitable for them will be discussed by one who has large experience in that line.

In case you conclude to plant some walnuts it will pay you to plant only budded trees and only those that are comparatively resistant to the blight.

Budding Over Almonds.

I have about a dozen large almond trees about eleven years old, they are about ten inches in diameter at the butt.

They are not of a very good variety.

Would it pay me to graft them, and if so, when should it be done.?

I would also like to know if a good silo could be a made by digging down into the hard pan where there is no water and either cementing the sides or leaving them bare?

If this kind of a silo would preserve the silage alright, about what diameter should it be made to feed five or six cows?—A. B. J., Escondido.

Do not attempt to graft over old orange trees, cut off the tops and bud into the sprouts during the summer while the sprouts are still growing.—J. W. M.

(Silo answer next week.—Editor.)

Grafting Walnuts.

I want a receipt for grafting wax, also when is the best time to graft the English walnut onto the Eastern black, and any more information you could give to help a greenhorn in the art. Hoping for an early reply in your columns. Subscriber.—Oxnard.

If you have young trees from last summer's planting of nuts, then graft them early in March. Keep your scions in sand that is just moist enough to prevent their shriveling, but keep your roots fresh. The grafting should be done just before the trees start to grow.

Dip your cloths in boiling beeswax, drain it from the cloth while it is boiling hot, allow to cool and tear in strips half an inch wide and wrap around the point of union of the graft. Better work can be done by digging up the trees and working with them on a bench. Pure beeswax is better than any mixture for this work.—J. W. M.

Cane Berries.

Will you tell me how to prune and care for Dewberries and, do you know any thing about the white raspberries and their value. Thanking you in advance for the information I remain, A. J. S., Buena Park.

Train the vines over a low frame made of wires stretched over cross

pieces nailed to short posts, so that the wires will not be over 18 inches above the ground. Allow the young growth that comes in the spring, grow flat on the ground, but train them to grow length-wise with the rows to keep them out of the way when the crop is gathered, cut out the old tops and in the fall train the new canes over the wires.

Of course, water must be given them as frequently as they require it. Plenty of stable manure will give them a good growth and fine fruit. The white raspberry is of no value compared with Cuthbert.

Homer Pigeons.

Will you kindly tell me through the columns of the Cultivator, what kind of pigeons are the best to raise, that is what kind would be the most profitable to raise on a large grain ranch?—N. R., Moorpark.

Homers are the best commercial pigeons. They are larger than the common pigeons, very healthy. They have large squabs, that bring 50 cents a dozen more than the smaller and when once they have had a nest at any place they remain there. They have more squabs in a year than the fancy pigeons. Any other information I will be glad to give.—Mrs. A. B.

Toulouse Geese.

Will you please tell me the price of Toulouse geese for breeding purposes and also what is the price of eggs.—Mrs. C., Sebastopol.

The price of Toulouse geese for breeding is from $5.00 to $10 per pair, according to quality and size.—Eggs are usually 25 cents each.—Mrs. A. B.

New Muskmelon.

We have received over 100 letters of inquiry concerning the source of supply of seed of the new muskmelon illustrated on our front page, issue of January. There appears an advertisement of the same in this issue and we refer all inquiries to the same, for the correspondence is quite burdensome.

Puffy Oranges.

If Mediterranean Sweets start to puff can it be benefited by subsoil or in what way can it be stopped.—H. R.

It has never been our good fortune to know or find any person who did know how to prevent puffing of oranges, or ever knew the cause of it.—J. W. M.

Land Plaster.

Please tell me if any one in Los Angeles handles land plaster and if it is good for our soils.— E. T. B., Orange.

The Agricultural Chemical Works of Los Angeles, whose ad appears in the Cultivator, informs us by phone that they have several tons of land plaster on hand. It is good for sour or alkaline soils.

Grafting Prune on Olive.

Will you kindly inform me, if it is possible to successfully graft the prune into the olive stock.—C. M. C., Vacaville.

It is not.

More than Anybody Asks.

The great lamp-chimney maker of world, Macbeth of Pittsburgh, not only makes the best chimneys, but prints a most useful Index to lamps and burners; from which one can find out what shape and size to get for his particular lamp.

One is no longer dependent on grocers etc., for the somewhat delicate service of fitting his lamp.

Orange growers and shippers in Riverside both agree that there is much less black scale than usual this winter.

Successful Farmers
USE
POTASH

There is nothing doubtful or indefinite about the results of using Potash fertilizer in the soil for truck crops. Every pound of Potash added, returns manifold its weight in vegetables. It is nature's law, and sure as the sun.

Every farmer should have "Truck Farming." It has much interesting information about fertilization. We send it free.

This Is a

Superior Generator

A gas machine for the country home. By its use you can have a bright light in every room. The SUPERIOR is absolutely perfect in its mechanism and operation. It can be placed in any home, whether old or new, at small cost. Tell us the number of lights you use and we will give you full particulars as to size of generator required and the cost of installing it. The information will not cost you a cent. We have this machine in use all over the coast and likely some one near you is using a SUPERIOR. Ask us about it. The Superior Generator is the result of long study and experience. We have improved it from year to year and now have a machine that is absolutely perfect in every way. Our catalogue illustrates all parts of the Generator. Sent free.

General Agriculture

FERTILIZERS FOR WHEAT.

TESTS conducted at different places for a number of years past have shown that it will usually pay well to use fertilizer on wheat.

While different soils, or even the same soil under different methods of treatment, require somewhat different fertilizers and about the only sure way of determining the exact needs of a particular soil is by the trial of a series of fertilizer tests on the same, it may be said in a general way that wheat soils are usually benefitted by all three of the essential fertilizing elements, viz., nitrogen, phosphoric acid and potash. Of these three elements phosphoric acid is usually needed in largest amount.

A fertilizer containing about 2 per cent. of nitrogen, 8 per cent. phosphoric acid, and 2 per cent. potash will produce profitable results in most cases and is very commonly employed. If used in addition to a heavy crop of clover, the percentage of nitrogen may be reduced but if used on land that has not been manured or clovered for several years the percentage of nitrogen can probably be increased somewhat with profit. Legume crops should, however, be used to supply nitrogen whenever possible, as they afford far the cheapest source of this element.

On some of the wheat soils experience has shown that somewhat more than 2 per cent. of potash can be used with profit, but on most of the yellow or red clays this amount should be sufficient.

A fertilizer of the 2-8-2 composition may be purchased ready mixed or it may be compounded at home from the raw materials. If mixed at home the nitrogen may be secured in the form of bone, tankage, nitrate of soda or dried blood. The phosphoric acid may be derived from acid phosphate or bone. Raw rock phosphate or "floats" is not recommended as a source of phosphoric acid in wheat fertilizers, as tests have shown that this material is not sufficiently available to produce satisfactory results in a single season. Potash may be derived from either the muriate, the sulphate, or kainit.

A good wheat fertilizer having the nitrogen, phosphoric acid, and potash in about the same proportion as in the 2-8-2- formula can be made by mixing:

Sodium nitrate, 14 to 16 per cent. N,	11 parts
Steamed bone, 1 to 2 per cent. N, 20 to 30 per cent. P O	15 parts
Acid phosphate, 14 to 16 per cent. available P O	30 parts
Sulphate or muriate of potash, 48 to 50 per cent. K O	4 parts
Total	60 parts

We believe that such a formula can profitably be used on soils of low and medium fertility at the rate of 180 pounds per acre, which would be equal to 300 pounds of the 2-8-2 formula. This amount would cost, for the materials contained, about $2.40. Our observation has led us to believe that too small an amount of fertilizer is usually applied to the wheat crop to produce the most profitable results.

Fertilizer is best applied to wheat at seeding time by means of a fertilizer attachment to the drill.

One of the best fertilizers for wheat, or most other crops, is barn-yard manure, but unfortunately most farmers are unable to make enough manure to cover their land and must resort to the use of commercial fertilizer. Manure alone, however, is not a well balanced fertilizer, as it is deficient in phosphoric acid. In order to increase the amount of this material it is excellent practice to add about 4 pounds of acid phosphate to each ton of manure as the same is being made. This not only results in increasing the phosphorous content, but also in preventing the loss of nitrogen. Manure will not only produce excellent results on wheat and other crops, but is also one of the best known means of insuring a catch of clover.

The best result from fertilizer can only be secured when the same is used in connection with proper preparation of the soil, good drainage good seed, etc. One need not expect the fertilizer to take the place of such necessary conditions any more than good tillage, etc., can be expected to take the place of the plant food necessary to produce the crop. It has been repeatedly observed, however, that liberal fertilization will tend to counteract the bad effects of unfavorable seasons, insect ravages, etc., by causing the production of strong plants better able to withstand such adverse conditions.

No danger of injury to the land from the use of fertilizer need be feared if clover or other fertilizing crops are used in the rotation to keep the ground loose and in good condition. If fertilizer is used constantly without such crops the ground may become hard and compact, due to the absence of organic matter— Arthur Goss, Indiana Experiment Station.

CORN GROWING EXPERIMENTS

In 1904, the Ohio State University undertook a comprehensive investigation regarding the relation of plowing at different seasons to the corn crop obtained, and many of the conclusions reached are of interst to the California farmer.

The object of this investigation was to determine the innuence of early and late spring plowing upon crop production. The study was carried along the lines of soil moisture, available nitrogen and soil temperature. The results found show:

1. The crop yield from the early plowed land is more than that from the late, at the rate of 6.6 bushels per acre.

2. That there is a very strong concordance between the yield per acre and by plots, and the amount of moisture per cent. and available nitrogen found in the soil during the season.

3. That the moisture-holding power of soils is greater with the early-plowed land at one, two and three feet in depth than that of the late, the greatest difference in its favor being found in the surface foot.

4. That when the moisture content of this particular soil falls below 7 per cent., the leaves of many plants curl early in the day, and the plant turns a yellowish color and is more or less checked in its growth.

5. That nitrification takes place with a gradually decreasing intensity, at one, two or three feet in depth.

6. That the seasonal average amount of available nitrogen found for the early plowed land in the su

face-foot is twice that found for the late at the same depth.

7. That the available nitrogen in the surface-foot of the early-plowed field is four times that found in either the second or third foot, early or late land.

8. That the mean soil temperature for the early plowed land is in all cases during the entire season, lower than that found for the late plowed.

9. That the low mean soil temperature found for the early-plowed land is accompanied throughout the season by a greater amount of moisture and available nitrogen than is the case with the late plowed which has the higher temperature.

10. That in many cases a high temperature is followed by a high rate of nitrification, while in others it is not, thus suggesting that the process of nitrification is more or less dependent upon what may be called the rate relation between the water content and the temperature of the soil, provided other factors are favorable.

A Natural Reservoir

WHAT AN INSECT IS.

The terms "insect" and "bug" are commonly applied to all minute organisms or anything that crawls; properly, an insect is a member of a certain class of lower animals, while a "bug" is a member of a certain order of insects. The term "blight" is incorrect, it being the common name of the fungus disease of plants, themselves low parasitic forms of plant life. Insects constitute the class Hexopoda or Insecta, and the derivation of the former Greek word gives the chief distinctive characteristic of insects, that is, they possess six feet. Insects are, zoölogically, closely related to spiders, scorpions and centipedes, lower forms of invertebrate animals, but further distinguished from them by having the body segments divided into three well defined parts, and supplied with certain appendages.

The production of aluminum in the United States has increased tenfold in as many years. In 1883 the total production was 83 pounds. In 1904 it was 8,600,000 pounds.

Oil and Water Mixed to Produce Oranges.

The transmutation of California Crude Oil into the golden citrus fruits is certainly something to be wondered at. Few citrus growers realize that they owe their success in a large measure to the rich deposits of crude oil in Southern California. Every orchard must have water, and the large part of that water has to be pumped. This requires power, and the cost of that power is a material part of the cost of production. With coal at $12.00 to $14.00 per ton to generate steam, and the expensive attendance of a steam plant, or with gasoline at 30 cents to 40 cents per gallon for use in gasoline engines, the Southern California citrus grower would find the development of water a very expensive proposition.

The orchardist must have soil, water and power, and he finds them all actually under his feet. The distillate from native oil is very different from the gasoline of the east, and for that reason many engines built for gasoline have great difficuly in using it; but the orchardist needs to find the ideal engine for the home fuel.

Pig iron and coke with steel and brass are the only products necessary to import, and out of these crude raw materials is fashioned, in our own Southern California, a distillate engine which has not only grown to be the popular motive power in Southern California, but which through its own intrinsic merits and the aggressive, enterprising management of the company has become the favorite in sections far removed.

If ten years ago a public statement had been made that thirteen thousand gallons of water could be taken from the ground and pumped forty feet high with a fuel cost of one and eight tenths of a cent, it would have been received as a huge joke; or a statement that the same quantity of water, two hundred and twenty feel below the surface of the earth and delivered on the ground for seventeen cents, (cost of fuel) it would have seemed a still more laughable proposition. Yet these economies are an every day matter ot the users of Western Gas Engines, burning the native No. 2 distillate. The economy is so marked that many large companies have taken out electric motors and substituted these engines with the result that in one year, the difference in the cost of operation fully paid for the engines.

These engines have also become famous for the generation of electricity, electric lighting plants using them having found the fuel cost to be considerably less than one cent per kilowatt. This will look like cheap electricity to farmers who are paying fifty to one hundred per cent more.

The Western Gas Engine Company, designers, patentees and builders of this engine, is a Sothern California enterprise, owned by our own people, paying wages and salaries to one hundred and fifty men, and supporting not less than four hundred to five hundred individuals. The engine was designed especially for the farmers of Southern California, and it is pumping water not only for citrus growers, but for every agricultural interest in the State. Alfalfa growers will see at once the enormous profits with water so cheap. The cost of fuel for small engines is so small as to be hardly a factor, but the necessity of continued and satisfactory operation have made the Western, with its many automatic arrangements the ideal power for the purpose.

It is the practice for the farmer to run his own engine leaving it operating while he is taking care of the water, so that there is no cost for engineer. The Company builds all sizes from 7 H. P. to 180 H. P. Maintain an engineering department,, designs, constructs and installs complete plants of any size, under guarantee as to the amount of water and quantity of fuel. Address the Western Gas Engine Company, Los Angeles, California.

Now is the time to go for gophers with **Bille's Gopher Poison.** The gophers go for it and it will go for them good and plenty every time.

This is a photo of 201 killed in one day on a ten-acre field before they could get back to their holes, wi h one bottle of

Bille's Gopher Poison

Endorsed by Agricultural Colleges and Experiment Stations. Not one of the ordinary poisons, but in a class by itself. Has had greatest success in the Middle West. The secret being that it is most attractive to gophers, squirrels, etc., and sure death to them. It gives the grain a glossy coating, retaining the poison for weeks. Hundreds also die in their holes by eating it there. We have bought the patent rights for this section and are selling at the eastern price of $1.25 for large bottle. The ingredients cannot be bought at a drug store for that price. Money refunded if not as represented—so printed on the bottle. If your dealer does not keep it, send $2.50 for two bottles, express prepaid by us. Any way send for circular with affidavit of above killing and a few out of many testimonials.

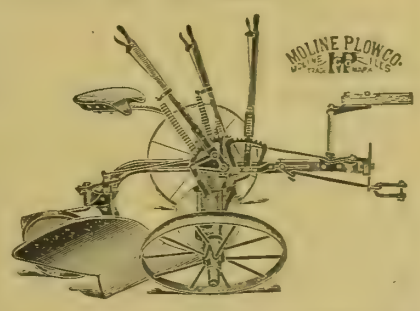
30,000 FARMERS Bought Good Enough Sulky Plows

last season. Since its introduction the sales on this tool have increased rapidly from year to year until last season it required, in round numbers, 30,000 to supply the demand. This ought to interest a man who is going to buy a plow. It means that after due consideration 30,000 farmers agreed that the Good Enough is

"THE BEST PLOW ON EARTH FOR THE MONEY"

A MOST DESIRABLE AND ECONOMICAL FEATURE IS THE EASE WITH WHICH BOTTOMS OF DIFFERENT SIZES CAN BE FITTED TO THE SAME BEAM.



The Good Enough is extremely simple. It has the desirable feafures of up-to-date and high priced sulky plows without the complicated construction of the very high lift type. The land axle has a yielding spring—uneven ground does not affect depth of furrow. **Turns square corners either right or left.** The landing lever and swinging clevis permit the operator to change the land of the plow instantly without stopping the team or leaving the seat. It is furnished with pole attachment when ordered. Made right and left hand. Sizes from 10 to 18 inches. Bottoms for every condition. Will plow any soil that can be plowed with a moldboard plow.

Wheels Have Removable Hub Boxes---DUST PROOF, OIL TIGHT

The Good Enough ALFALFA BOTTOM has no equal.

ASK YOUR DEALER TO SHOW YOU THE GOOD ENOUGH.

Citrus Market

The latest news of any scope, which has been received from the New York market is as follows; shorter and more consise notes of later date appearing as preludes to the price schedules.

Fortunately, citrus shipments have been rather light of late. The market has absorbed with considerable enthusiasm the fruit that has been offered, and has, under nearly all circumstances, paid a good price for it.

The orange market fell off from 25 cents to 50 cents per box in New York on Monday of last week, and continued weak until Thursday, when a marked improvement was noticed. Other auctions did not show any weakness and prices remained good. Diversions of a lot of fruit that had been tramping the country was the main cause of low prices in New York.

Up to Monday only about ten cars a day had been offered, and as this was all fresh fruit of good quality, prices held up. On that date thirty-four cars, largely stale fruit, was sold and prices went down with a rush. Dealers have been very conservative this year and have been expecting just such a break and now that it has arrived and a lot of old fruit gotten out of the way the situation will clear a little. Lack of cars will prevent any great congestion. The fruit is good, and when dealers get educated to the large sizes, the market should show a rapid improvement, provided weather conditions are normal.

So far there have not been many reports of freezing en route except of some of the cars that had been out anywhere from one month to six weeks.

On the whole the situation is not at all bad and, though orders will be slow in coming for the next two weeks, there seems to be no good reason why all the fruit going out should not find a ready market at fair prices. All shippers concede that the country can absorb 150 cars a day at this time, and for the past seven days but 120 cars a day have been forwarded. As soon as the trade realizes that they are not to be flooded with fruit, they will get over their present pessimistic attitude and buy freely. F. o. b. orders are very slow at the present time, but the shipper does not seem to be disposed to lower prices on that account. For high grade oranges from the best districts they are quoting at from $1.75 to $1.85 for extra fancy, $1.65 to $1.75 for fancy, $1.50 to $1.60 for extra choice, and from $1.25 to $1.40 for choice. There is yet over 100 cars of northern fruit left in Tulare couty. The sizes of this fruit run from 176s to 216s and is in great demand on that account. The extra fancy northern fruit, $2 a box, is freely offered.

NEW YORK MARKET.

NEW YORK, Feb, 6.—A heavy blizzard raged all day yesterday, tying up traffic and business and no sales of citrus fruits were made.

Sales on the 4th were as follows:

The market is practically unchanged. It is snowing. Twenty-six cars oranges and two cars of lemons sold today.

WASHINGTONIA FILIFERA AND ROBUSTA and Euretia edulis palms, from 5 to 10 feet high, to exchange for other kinds of nursery stock or sold for cash. Give offers. Enough for carload lots. Erickson & Heinz, Brawley, Cal.

FOR SALE.—500 MISSION OLIVE TREES 20 to 25 dollars per 100, fine stock. H. L. BAUER & SON, 737 So. Spring. St.

BERRIES.

HIMALAYA BERRY PLANTS—2 FOR 25c. $1.00 per doz. $6.00 per hundred. Express prepaid. BASSETT'S FLORAL GARDEN, Loomis, Cal.

HIMALAYA BLACKBERRY, $1 PER DOZ., $6 per 100: Mammoth Blackberry, Loganberry and Lucretia Dewberry, 50c per dozen, $3 per 100.
Adelbert Cooley, R. D. 2, Laton, Cal.

COFFEE.

SPARR'S JAPARA COFFEE-YOU AND YOUR friends are offered an opportunity to buy the finest drinking coffee grown, price 25 cents per lb., packed in 5-lb. cans, one dozen in case, 60 lbs., freight prepaid. This is about two-thirds of the usual price charged for ordinary coffee. Send $2.80 for 10-lb. can. Liberal sample sent by mail on receipt of 4 cents postage. F. W. Sparr, 114 East Market St., Los Angeles, Cal.

LOVERS OF GOOD COFFEE—YOUR ATTENtion is respectfully called to the above advertisement. If you enjoy a cup of really good coffee you can buy it from me almost as close as you can buy sugar. Make up an order with your neighbor and write to me. I am a direct importer of Tea and Coffee and can save you money. I ship to all parts of the Pacific Coast and guarantee every pound fresh and pure. Established in Los Angeles ten years. F. W. Sparr, 114 E. Market St., Los Angeles.

"The Farmer's Fire-Arms Company."

There are upward of fifty million rural residents in this country, and in every one of these farmer's families there is needed:

First: A good, strong, accurate and reliable revolver to protect house, barn and hennery from burglars and sneak thieves, and, when occasion requires, to slip in the overcoat pocket when out on the lonely roads.

Second: A good, accurate and reliable single-shot rifle for killing beeves, sheep and hogs and for shooting hawks, squirrels, rabbits and other game.

Third: A good reliable shot-gun for hunting quail, partridges, shooting wild ducks, wild geese, wild turkey, etc.

These should be all made by reliable manufacturers, who have their name stamped on them, in order that there will be no danger of cheap materials and accidents. But they need not be expensive unless the farmer likes "to make a show."

Every farmer needing a fire-arm of any kind should send for Hopkins & Allen's big "Gun Guide and Catalogue" for 1907. This book tells exactly how to pick out the right kind of fire-arm for the use you intend putting it to, and explains in detail the material, workmanship and finish that is put into each Hopkins & Allens arm. Write to the Hopkins & Allen Arm Company, 103 Franklin street, Norwich, Conn., and get copy of this "Gun Guide and Catalogue" free.

Making a Hit.—Biggs—Did DeRanter make a hit in his new play last night?

Diggs—No, I think the hit was made by some one located in the gallery. De Ranter was the target.

POULTRY.

HOLMBY POULTRY FARM,
Breeder of S. C. Black, Buff and White Orpington, Barred Rocks, S. C. White Leghonrs, Pekin Ducks, Mammoth Bronze Turkeys, Tumblers and Homer Pigeons, 130 Prenuims won at 4 shows. stock and eggs for sale,—write your wants. ARTHER LETTS Prop., WILL PURDY, Manager, Hollywood, California.

ORPINGTONS AND REDS; PEKIN DUCKS—13 prizes on 16 entries also silver cup at "Breeder's Show" 1907. Eggs now ready, can't help but hatch winners, we breed them that way, fifteen years' experience counts. Our stock are great layers, rapid growers, top market quality, we guarantee satisfaction. GOODACRE BROS., Box 45, Compton, Cal.

BLUE ANDALUSIANS—I did not exhibit this year but have better stock than ever. A few nice trios for $5.00, also good breeding cockerels for $2 and $3 each. Must have the room they occupy. Eggs for hatching $2 and $2.50 per 14. No fear of inbreeding as we have three strains.
MRS. T. R. GRIFFITH, 3111 Walton Ave.

FOR RENT—TURKEY RANCH, EITHER 40 or 80 acres suitable for turkey and chicken ranch—natural pasture, land will grow alfalfa, millet, etc., artesian well flowing 46 inches, dry climate, near Thermal Cal.—For particulars, address THEO. PAYNE, 345 S. Main St. LOS ANGELES.

EL MONTE—BUFF COCHIN BANTAMS, winners at St. Louis World's Fair, also at the Los Angeles show. Gray or Toulouse geese, guinea fowls, eggs for hatching at reasonable prices. BERT REYNOLDS, El Monte, Cal.

FOR SALE—BARRED ROCKS, WINNERS OF 11 prizes and Silver Cup for Best Barred Rock Male at Breeders Show, 1907. Some choice cockerels for sale. Eggs. Write your wants. Frederick Espe, 4425 So. Main St., Los Angeles, Cal.

FOR SALE—EGGS FROM TWO PENS OF extra fine White Plymouth Rocks, $2 per 12. FRANK H. THOMAS, 1820 Hobart Blvd., Los Angeles, Cal.

BLUE ANDALUSIANS— THOROUGHBRED stock, good laying strain. Eggs $1.00 per 14, $5.00 per hundred. OAKDALE RANCH, Fallbrook, Cal.

SILVER LACED WYANDOTTES

At the recent Poultry Breeder's Show we won eight ribbons on eight entries. "The best quality seen here for years, 1st cockerel has the best marked wing we have seen." —Pacific Fancier.
Eggs $1.50 per 15.

WHITE PLYMOUTH ROCKS

Grand laying strain, large vigorous stock, eggs especially recommended for incubator hatching, $1.00 per 15, $5.00 per 100, special mating $1.50 per 15.

FAIRVIEW POULTRY YARDS
A. E Nelson, El Monte, Cal.

Burbank Phenomenal Berry Plants

Choice plants grown from tips only 75cts. per dozen net, $1. per dozen by mail. $5. per hundred; 50 at hundred rate.
C. NELSON, MONETA, CAL.

Simplicity

Men utterly unfamiliar with gasoline engines find no difficulty in learning to handle

"Western" Engines

WATER PUMPED BY 50 H. P. "WESTERN" ENGINE

Large Plants Our Specialty, up to 700 H. P.

Western Gas Engine Company, EL MONTE, CAL., Oct. 15, 1906.
Los Angeles, California.

I have been using one of your 50-H.P. "Western" engines to pump water on my ranch at Bassett, for the last two years.

The high recommendations the "Western" received from some of my neighbors made me expect a great deal of the engine. Yet, notwithstanding the fact that I never ran a gas engine before, it has given me no trouble, and in its ease of operation, fuel economy and wearing qualities, my highest expectations have been more than realized.

I have no trouble in starting it by myself. In fact, a child could almost operate it, and it needs so little attention that I can easily run the engine and do the irrigating at the same time.

I am lifting 175 inches of water 65 feet, and using a little less than 5½ gallons of No. 2 Distillate per hour.

I am pleased with the engine and the way you have treated me, and if I were to buy a hundred engines, they would certainly be "Westerns."

(Signed) R. E. DANCER.

P. K. WOOD'S

Improved Deep Well Propeller Pump

FOR IRRIGATING AND MINING

After devoting several years to deep study and experiments, and the expenditure of many thousands of dollars, this pump has been brought up to the point where it is practically indestructable, has an efficiency not to be excelled, and is ready to try conclusions with any deep well pump on earth. The principal improvement consists of a screw guide inserted in casing cupling and a ball bearing placed in each guide, which gives absolute protection to all parts of the pump, regardless of the amount of sand or grit which the water may contain. Write for catalogue and full description of these important improvements.

P. K. WOOD, Patentee and Manufacturer
702 No. Main St. Los Angeles, Cal.

Irrigation and Pumping

WASTING WATER ASSETS.

CALIFORNIA has learned, not only that the ground may become water-logged by over-irrigation, but that ill-considered drainage works an inconsiderate use of the water obtained from wells may so reduce the subsurface supply of water and so lower the water-plane or "table" as to threaten the reversion of large areas to comparative unproductiveness..

The United States geological survey has demonstrated that practically all the subterranean waters of a large district in Southern California, embracing 775 square miles, are connected, and that every well taps a common supply.

The overworking of pumps, the use of larger volumes of water than is necessary, and unwise drainage, have enriched the ocean with a volume of water so much larger than the rainfall, that the water-plane, which was 23 feet below the surface of the soil in 1898, is now 50 feet below.

The Californians have followed the American habit of believing natural resources to be "inexhaustible," and are amazed to find that in respect to water also they have lived beyond their means, as well as in respect to the timber supply, oil, natural gas, fish and game.

California is by no means the only state where such a condition may occur, or where the discovery may be made, too late, that water is an asset which cannot be thrown away without a penalty. Drainage schemes should everywhere be managed with a view to the possible future need of the water for irrigation.

In the California district named the waste may be repaired by the expensive works which are to bring water of the Owens river from the mountains to Los Anegels, and incidentally afford a volume for irrigation. But mountain streams are not everywhere available.

RURAL WATER SUPPLY.

In comparing the advantages of a country life with those of an existence in the city, one nowadays frequently encounters the argument that the city resident enjoys better health protection than his country brother. This is undoubtedly true, to the extent that water and the carelessness and ignorance of the individual are factors in the public health.

The crowding together of people in cities renders imperative a system of municipal care and oversight. The water supply is usually carefull selected and its purity zealously guarded; there is an efficient sewerage system to dispose of the city's waste; hospitals and pest houses are maintained; a laboratory of hygiene provides for the inspection of milk, the detection of food adulteration, and the prompt and exact diagnosis of disease.

Several of the older States now specially provide for the examination of water supplies, both rural and municipal, but while compulsory periodic inspection of such has been the rule for some time in Germany it is not until recently that anything of this nature has been enacted in the United States.

The Legislature of North Carolina established a precedent for other States to follow in passing a law which provides for the compulsory quarterly, chemical and bacteriological examination of all public water supplies within the State. Where bad conditions are found, this law provides that if proper steps are not taken within thirty days to remedy such, there is to be published in the local papers, "a plain statement of the facts for the information and protection of citizens using water."

BASIN IRRIGATION.

This method is confined for the most part to orchard irrigation. Its use, however, even for this purpose, seems to be decreasing rather than increasing. Many owners or deciduous fruit orchards have of late changed their mode of irrigating from the basin to the furrow system.

Nevertheless, the basin system is likely to continue to be popular and prevalent wherever favorable conditions exist. The conditions which are best adapted to this method are suitable crops, such as fruit trees, a plentiful supply of water during the time of irrigating, and a light, porous soil, or else a soil which cannot be properly moistened by furrows.

In the warmer portions of California, Arizona, New Mexico and Texas the winter irrigation of crops, particularly orchards, is becoming a fixed practice and is attended by beneficial results. As a general rule, the water supply in the places named is then abundant, and large quantities may be applied to the soil in a brief time by the basin method.

IRRIGATING BY CHECKS.

Experience of irrigators has demonstrated that the check method is best adapted to a light, sandy soil having a comparatively even slope of from 3 to 15 feet per mile. On the other hand, it has been shown that a field having a steep slope should not be checked, since such checking would require the levees to be made so high and steep and so close together that farming operations would be rendered difficult and a large part of the field withdrawn from crop production.

"That man is one of my friends," remarked the novice in public life.

"Which kind?" responded Senator Sorghum. "Friends, you know, are divided into two great classes; those whom you need and those who need you."

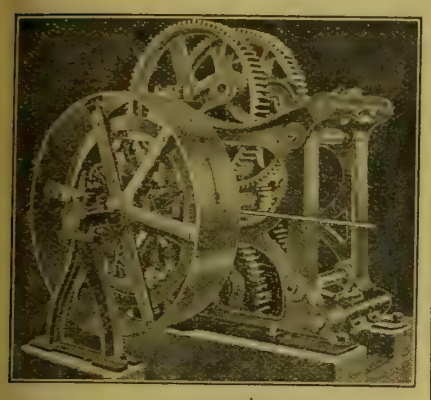
DON'T BUY GASOLINE ENGINES UNTIL YOU INVESTIGATE "THE MASTER WORKMAN," a two-cylinder gasoline, kerosene or alcohol engine, superior to any one-cylinder engine; revolutionizing power. Its weight and bulk are half that of single cylinder engines, with greater durability. Costs Less to Buy—Less to Run. Quickly, easily started. Vibration practically overcome. Cheaply mounted on any wagon. It is a combination portable, stationary or traction engine. SEND FOR CATALOGUE. THE TEMPLE PUMP CO., Mfrs., Meagher and 15th Sts., Chicago. THIS IS OUR FIFTY-THIRD YEAR.

The Pomona Pumps Are Best



for City Waterworks and Irrigation

BECAUSE—

Using machine cut and slow running gears, they are

PERFECTLY NOISELESS.

They use stepped gearing with no break in the tooth contact, doing away with all rattle and vibration.

BECAUSE—

They have an ideal motion of the pump rods, which consists of a uniform continuous slow up motion, a smooth, quick down movement with absolutely no jerk in starting the rods upward eliminating all rod breakages and valve troubles.

BECAUSE—

They will save you money in cost for power. We use machine cut gearing which alone saves ten per cent. We have a leverage in our gearing which other pump makers do not have and which they do not tell you about when trying to down us.

BECAUSE—

In pumping through long pipe lines, they deliver a continuous steady stream.

They do not hammer out your pipe line by irregular pulsations of the water column.

They save power by keeping the water in continuous motion.

BECAUSE—

They are fitted with improved oiling devices that can be filled without stopping. Pumps may run for weeks continuously.

BECAUSE—

We have advantages in our pumps that investigators appreciate at once, consequently, where one goes others follow and we are fast taking the country.

BECAUSE—

We give a guarantee of satisfaction with every plant.

IRRIGATION MADE CALIFORNIA.

California is today recognized as the garden of the world, devoted most exclusively to fruits, producing as it does nearly all known varieties of the temperate and semi-tropic zones.

The apple is here produced in perfection, and beside it we find that the orange and the lemon mature in a way that is unsurpassed by the fruits of any other country in the world, while the Muscat grape produces a raisin that is not outranked by the raisin of any other climate.

Originally California was a grazing State, where long-wooled sheep and long-horned cattle roamed over the plains in company with bronco horses, unmolested by the trains of commerce and unobserved by modern civilization.

In a natural state, California was a desert country, except that along some of the streams there was a strip of moist land that could be depended upon with more or less regularity every year for a limited amount of feed, and in some localities there were limited areas of moist and cienega lands, which were considered as oases, when food and water failed in the country at large.

In wet seasons the plains were covered with alfilarilla and other native forage plants, and the flocks and herds flourished; but in dry seasons the bones which were strewn over the plains told too plainly that the stock business had been overdone and that the country was a failure for sheep, cattle and horses, because there was more loss in dry seasons than there was gain in the more favorable ones.

As an aid to stock-raising, the sowing of grain was practiced on the plains, but this, too, was an extra hazardous undertaking, and failure was more frequently met with than success in many localities.

With these uncertain industries for the people to depend upon, civilization was at a low ebb, and the wheels of progress appeared to turn backward about as much as they did forward.

Aside from the old missions, which had been established many decades ago, churches were almost an unknown quantity, and the schoolhouse was the exception to the rule, and when found it was of a primitive and inferior character.

Southern California, under the old regime, before the introduction of irrigation on a large and intelligent scale, was a failure, and modern civilization was making no headway.

Two or three decades ago American enterprise and Yankee push got a foothold and began to look around for a programme for developing the natural resources of the country. Enough had been done in a crude way to establish the fact that, as a fruit country, this could be made a success, at least in a limited way, but the systems of irrigation were precedent conditions to the establishment of orchards and vineyards, for without water artificially applied, fruit culture must be a failure.

Gradually the streams were turned out of the beds, and the waters thereof were spread out over the arid lands. Trees and vines were planted. The home fruit markets were supplied, and avenues were opened for shipping the surplus crops of the country. Railroads were built to carry the passengers and freight. The demand for our superior fruits from the outside world grew more rapidly than did our trees and vines. Prices were good, and our people made money.

When writing advertisers mention Cultivator

QUALITY OF IRRIGATED APPLES.

There is a feeling in the public mind that apples and other fruits grown under irrigation are not equal in quality to the same kinds produced where this method of supplying moisture to the soil is not necessary. I am not fully prepared to positively deny the truth of this theory, but many opportunities that I have had to compare fruits of many kinds grown under the two conditions leads me to believe that it is the abuse of irrigation that is largely responsible for the poor quality of much of that which is not up to the standard in this respect. Again, the lack of sufficient water in the soil has the same effect, although the condition is reversed—that is, from too much water or too little.

In the former case there is an overplus of moisture in the soil, which is an abnormal condition and may result in very large fruit poor in quality, while the opposite abnormal condition—that is the want of sufficient moisture to enable the tree to properly develop its fruit—makes it poor in quality. Nature requires about certain proportions of light, heat, moisture and plant foods to bring its products to perfection and when this balance is disturbed by untoward climatic conditions or unwise interruptions by man a penalty will follow as sure as one and one makes two. We see apples in some of the irrigated regions grown under conditions of excessive soil moisture which are large and showy but poor in flavor.

On the other hand, small woody apples, dry and lacking in richness have resulted from insufficient or untimely irrigation, or lack of normal rainfall in the humid regions. Therefore, it seems reasonable to lay the blame for poor quality of apples as well as other fruits to the abuse of irrigation rather than to the fact that they were grown under irrigation. I have eaten just as good apples grown by irrigation in our western states as those of the famous apple growing regions of the east and I have caused many persons who were experienced and well posted in flavor and other qualities of apples to make comparative tests of specimens from these distant sections grown under the two conditions. In almost every case the prejudice against irrigation, if any existed, was removed.

Prof. H. E. Van Deman.

IRRIGATION METHODS.

In the countries where rainfall is small and droughts consequently frequent, irrigation, the art, for such may it be termed, of increasing the fertility of the soil by artificial water supply, assumes an important character. Ruins of ancient irrigation works are still to be found in Egypt, India and China, those of the first mentioned country being particularly numerous. The irrigation farmer of today could learn a few good lessons by studying the methods that were in vogue in ancient times to give each owner of land an adequate supply of the water.

LOSS BY EVAPORATION.

Evaporation annually deprives the California farmer of a large amount of water which he might utilize to good advantage. By this process water is withdrawn from the surfaces of storage lakes and reservoirs, irrigation canals, and flooded fields. By the same process moisture is continually passing from the surface of fields, whether irrigated or farmed dry.

20 Reasons WHY THE Addison Pump

Is Better Than All Others

1. It will pump more water with less power.
2. It is more substantially constructed.
3. Has no overhanging bearings to spring and cause friction.
4. Absolutely uniform—does not break rods.
5. Plunger leather can be changed with less trouble and expense.
6. Water discharge in continuous stream—no pulsations.
7. Noiseless in operation.
8. Has no jar or hammer.
9. Perfectly balanced, no braces are required to keep pump in position.
10. Will be in good working order when other pumps with erratic or variable motion are in the scrap pile.
11. The frame contains within itself the main bearings, which are unusually large.
12. The cranks consist of three gearwheels, pinned on opposite sides, thus forming a double crank.
13. The outside gears are shrouded on the inside and the center gear on both sides. The pinions are placed on two counter-shafts in main frame in such a manner that the shrouds of the gears rest on the shrouds of the pinions, forming a bearing to carry the load when pumping, and thus keeping the teeth in proper mesh, giving the greatest strength and least wear and distributing the weight over six boxes.
14. The pitman rods are of the same length and are forged from one solid piece of best machine steel.
15. The driving and countershafts have only 22 inches between the bearings which carry the load, and with the size of shaft used makes it impossible to swing out of line, under the heaviest of work.
16. The cross-heads are planed and fitted with tempered brass strips made to fit groves in columns; so arranged that wear can be taken up.
17. Both pump rods are fastened to the cross-head pins, so there is no pulling strain on the cross-head proper.
18. By our specially constructed couplings, rods are as strong at joints as at any other part.
19. The Addison Patent Straight-Waterway Valves offer a free passage for water, causing less friction than in any other valve.
20. Pump can be operated without a stop as the following testimonial proves:

Addison Pump Co.,
Pomona, Cal.
Gentlemen:—

In reply to your inquiry of Dec. 24th., I am glad to say that your pump has now worked steadily for over two years with entire satisfaction.

As far as I can recall it has never had to be repaired, and has never missed a stroke.

Very truly,
J. H. McBRIDE.

Pasadena, Cal., Dec. 28, 1906.

If you will come to Pomona and spend a day with us we will show you our pump and other pumps in operation, then leave it to your own judgment to select the best.

We give an iron clad guarantee with every plant.

IT WILL PAY YOU TO INVESTIGATE THE ADDISON BEFORE PURCHASING A PUMP.

LITTLE BOY BLUE.

The little toy dog is covered with dust,
But sturdy and staunch he stands;
And the little toy soldier is red with rust,
And his musket molds in his hands.
Time was when the little toy dog was new
And the soldier was passing fair,
That was the time when our Little Boy Blue
Kissed them and put them there.
"Now don't you go 'till I come," he said,
"And don't you make any noise."
So toddling off to his trundle bed
He dreamt of his pretty toys.
And as he was dreaming an angel song
Awakened our Little Boy Blue—
Oh, the years are many, the years are long,
But the little toy friends are true.
Aye, faithful to Little Boy Blue they stand,
Each in the same old place,
Awaiting the touch of a little hand,
The smile of a little face.
And they wonder, as waiting these long years through,
In the dust of that little chair,
What has become of our Little Boy Blue
Since he kissed them and put them there.—Eugene Field.

HIS ANCHOR.

A YOUNG man trudged with a sprightly step along a dusty road. A farmer passed him and looked back. The stranger was not of the cut that was usually seen walking in those parts, such persons preferring an automobile or a carriage. Not that his clothes were especially fine; it was something in the general appearance of the young man himself.

Climbing a stone wall, he entered a wood, mounted a slight rise in the ground, then descended to a small artificial lake and crossed a rustic bridge. While leaning over a guard rail looking at some water lilies he heard a woman's voice coming from behind him:

"Strangers are not admitted to these grounds, sir."

The man turned and saw a very pretty girl shading her eyes with a red parasol from the autumn sun. Raising his hat, he replied:

"I saw no prohibition notice as I entered."

"If you had entered by the gateway, you would have seen one."

"But I didn't enter by the gate."

"For that reason I have spoken to you. Persons coming in here socially or on business don't climb the wall."

"I'm sorry to have trespassed. By your speech I judge you own the place."

"My father rents it."

"That makes him and his family owners so far as occupying it exclusively for themselves is concerned. Don't you think it a bit selfish in you to begrudge a poor traveler the pleasure of resting in the cool shade?"

"Should we do so we would be overrun. Besides, they pull things to pieces. We are especially anxious to keep it in good order just now, for our lease is about to expire, and we wish to turn it over to the owner in first-class shape."

"A very exacting person, I presume?"

"Oh, no; it is we who are particular. Mr. Chichester concerns himself very little about it."

"Chichester? What Chichester?"

"Robert, I believe."

"You don't mean it? Bob Chichester! I know him well."

The girl cast a suspicious glance at the stranger.

"You think I am imposing on you. I will describe Chichester and prove to you that I really know him."

"That wouldn't avail anything, for I never saw him myself."

"You know that he has been a student at Oxford, England?"

"Yes, I know that."

"Well, we both, being Americans, knew each other. But I didn't fancy him."

The girl's eyes flashed.

"Unluckily he is not here to return the compliment."

"Oh, I can do that for him. His opinion of me is my opinion of him."

"Superior persons are usually disliked by their inferiors."

"Bob Chichester isn't my superior," he said with remarkably good nature, "We're two of a kind—a pair of knaves."

"Knaves always consider other persons knaves. Perhaps that's the reason of your opinion of Mr. Chichester."

"And the reason of his opinion of me."

"I have only your word for that, and since you confess yourself a knave I give that for it." She snapped her fingers viciously.

"May I ask a reason for this defense of a man you have never seen?"

The girl hesitated. She knew the folly of chatting thus confidentially with a stranger, but being interested in defending the landlord she threw caution to the winds.

"Since renting this place my father has had nothing but misfortune and is unable to pay the whole of a year's rent due. He wrote, or rather, I wrote for him, a full statement of the matter to Mr. Chichester, who replied with unbounded generosity, inclosing a receipt for the amount."

"Oh, you were the writer of that letter?"

"Mr. Chichester must be a confiding person to have shown it to"—

"A knave. Certainly. Didn't I tell you we were both knaves? You see, Chichester and I are a sort of Dr. Jekyll and Mr. Hyde. It was I who prompted him to write that letter."

"Well, I declare!"

"Fact. Bob declared he wouldn't do it; vowed he'd sue the account although you said such a course would bring down a multitude of creditors on your father. I shook my fist at him and told him"—

"Stop!" She stood looking at him like a fury. "Leave these grounds."

"I decline to be ordered off my own property."

"Your own property?"

"Yes, I own this place, and when I received that letter I resolved that I would come home and do my best to become the owner of the woman who could write such a letter."

She stood staring at him in a sort of dazed wonder. He advanced and put out his hand. She made no move, and he went on rapidly feeling for hers at the same time:

"You see that I have given you a correct picture of myself; mean inclinations and noble aspirations; bad one day, good the next. All I need is a sheet anchor to hold me to the good. When I read your letter I knew I had found the anchor. It only remains for me to secure it."

F. A. Mitchell.

JAPANESE FRIENDSHIP.

Mr. Dooley's latest essay discusses the Japanese question, under the title, "A Broken Friendship." It is in the pholosopher's rich vein of wit and humor, as the following extracts prove. Dooley talks like a Native Son, and California should adopt him.

"We're sure to have war with th' Japs inside iv two years," said Mr. Dooley. "Hogan says we're got to fight f'r th' supreemacy iv th' Passyfic. Much fightin' I'd do f'r an ocean, but havin' taken th' Phil'lippeens, which ar-re a blamed nuisance, an' th' Sandwich Islands, that're about as vallyble as a toy balloon to a horseshoer, we're got to grab a lot iv th' surroundin' dampness to protect thim. That's wan reason why wer're sure to have war. Another reason is that th' Japs want to sind their forty-five-year-old childher to be iddycated in th' San Francisco public schools.

"Wud ye iver have though 'twas possible that any wan in this country cud even talk iv war with thim delightful, cunning little Orientals? Why, 'tis less thin two years since we hollowed with joy whin a Rooshyan admiral put his foot through th' bottom iv a man-iv-war an' sunk it. An' how we cheered in the theayter to see th' cute little sojers iv th' Mickydoo mowin' down th' brutal Rooshyan moojiks with masheen guns. An' fin'lly whin th' Japs had gone a thousand miles into Rooshyan territory an' were about busted an' ayether had to stop fightin' or not have car fare home, our worthy Prisiden jumped to th' front an' cried: Boys stop it. It's gone far enough to satisfy th' both iv ye.'

Day afther day th' pa-pers come out an' declare that th' defeat iv Rooshya was a judgement iv' th' Lord on th' Czar. Hogan talked about nawthin else. They were a wondherful little people. They cud shoot straighter an' oftener thin anny other nation. A Jap cud march three hundhred miles a day f'r eight days with nawthin' to eat but a gumdhrop. They were highly civvylized. It was an old civvylization but not tainted be age.

"Their threatment iv women put thim on a higher plane thin ours. Chinchries ago, befure th' higher iddycation iv women was dhreamed iv in this counthry, th' poorest man in Japan cud sind his daughter to a tea house, which is th' same as our female siminaries, where she remained till she gradyated as th' wife iv somepround noble iv the old Samuri push. An' even in th' wan branch iv art that westhern civvylization is supposed to excel in they had us beat miles. They were th' greatest liars in th' wurrld an' formerly friends iv th' President.

"That was th' beginnin' iv th' end iv th' frinship between th' two gr-reat nations. A well-known fi-nancier who thraveled to Tokeoo with a letter iv inthraduction to th' Mickydoo fr'm th' Prisident beginnin,, 'Dear Mick,' got a brick put through his hat.' A little later a number iv Americans in private life who wint over to rayceive in person th' thanks iv th' imprer f'r what they'd done, were foorced to th' warmth iv their rayciption to take refuge in th' house iv th' Rooshyan counsel.

"Last month th' Jap'nese governmint wrote to th' Prisident: 'Most gracious an' bewilderin' Majesty, Impror iv th' Sun, austere and patient, Father of the Stars, we adore ye. Had ye not butted in with ye'er hivinly binivolence we wud've shook Rooshya down f'r much iv her hateful money. Now we must prove our affection with acts. It is our intintion to sind a fleet to visit ye'er shores, particklY San Francisco, where we undherstand th' school system is well worth studyin.'

"An' there ye ar-re Hinnissy .Th' frindship ceminted two years ago with blood an' beers is busted. I don't know whether annything will happen. Hogan thinks so, but I ain't sure. Th' Prisidint has announced that rather thin see wan octoginaryan Jap prevented fr'm lrrnin his a-bee-abs, he will divastate San Francisco with fire, flood, dynnymite, an' personalities. But San Francisco has had a pretty good bump lately an' wud hardly tur-rn over in its sleep f'r an invassion and if the Prisidint want thim to enther th' schools he'll have to load thim in th' cannon an' shoot thim in.

"Wudn't it be th' grand thing though if th' licked us an we handed thim th' Ph'lippeens!"

" 'Your wife is in rather a bad way. He hesitated. Then he went on solemnly: 'Do you want to know the worst?'

" 'Certainly,' said the husband, 'certainly. Tell me the worst—is it to be Palm Beach or the Riviera?' "

AMONG THE MIZ'N.

George held her hand and she held his'n,
And then they hugged and went to kiz'n,
They did not know her pa had riz'n—
(Madder than hops and simply siz'n,)
And really tiz'n right to liz'n,
But George got hiz'n and went out whiz'n.

TWO PIANOS! CASH! BIG PRIZES FREE!

If this chart gets destroyed another printed upon heavy paper will be sent upon receipt of 2c stamp for postage.

CAN YOU COUNT THESE DOTS?

SUCESSFUL FARMING WILL GIVE TO THOSE WHO CAN COUNT THE DOTS IN THE PIANO CORRECTLY OR NEAREST CORRECTLY, THE FOLLOWING LIST OF PRIZES: CAN YOU DO IT?

Two Elegant Pianos, one to a lady and one to a gentleman.
2nd. Two Hundred Dollars Cash.
3rd. One Hundred Dollars Cash.
4th. Fifty Dollars Cash.
5th. Twenty-five Dollars Cash.
Next 5. Ten Dollars Each.
Next 10. Five Dollars Each.
Next 25. Two Dollars Each.

CONDITIONS: 50 cents pays for one year and one count. $1.00 pays for two years and three counts. You get $50 extra if you have three counts. It will pay you to have three. See conditions below.

DON'T DELAY!

IF YOU WANT A PIANO OR OTHER PRIZES FREE SEND YOUR COUNTS AT ONCE

CONDITIONS—50 cents pays for a year's subscription to SUCCESSFUL FARMING and one count; $1.00 pays for two years and three counts and makes you eligible for the special $50.00 prizes given to winners of 1st prizes if they have three counts. See below.

AWARDS will be made as follows—The person giving correct or nearest correct count will get first prize. Next nearest second, etc.

$50 PRIZES—We believe everybody should have three counts so they can have one each side of what they think is correct to be more sure to hit it. To encourage this we will give $50.00 extra to winners of 1st prizes if they have three counts. Remember if you have one count you get piano only, but if you have three counts you get $50 extra.

TIME PRIZES—$25.00 Extra. We feel early counters should be rewarded and we will give $25.00 to the person sending best answers by Feb. 28th.

OUR RESPONSIBILITY—We are a responsible business house, and every prize must be and will be paid as stated. We refer to Iowa National Bank, Central State Bank, German Savings Bank; in fact any Bank, Express Company, business house or individual in Des Moines, as well as Dun or Bradstreets Agency, or the publisher of this paper.

JUDGES—We have wholly disinterested judges to award prizes. Here is what they say:

TO WHOM IT MAY CONCERN: We have been asked by the publishers of SUCCESSFUL FARMING to act as judges in their contest and see that prizes are all awarded fairly. This we will gladly do guaranteeing each contestant absolute fair treatment. Signed—W. W. MORROW, Treasurer State of Iowa; HUGH BRENNAN, Judge District Court; Rev. A. J. WILLIAMS.

In case of tie we will write each person so tied asking them to make as few words as possible from the letters of the alphabet, using each letter of the alphabet twice and only twice, and no one word more than once, each letter left over counting as one word. To the one tied in the counting who gives us the fewest words as above will be awarded first prize. This practically eliminates all question of tie, but if there should by any possibility be a tie in this the prize will be divided equally between those so tieing.

Subscription without counts is 25 cents per year, additional counts after you have three entered as per our terms in paragraph "condition" above may be entered at 25 cents each.

This contest is not to be confused with the guessing or estimating contests. Our contest is a test of skill in planning and counting and the best man wins. Nobody connected with our paper will be allowed to compete. Contest closes June 30, but get your counts in at once. See about time prize above.

PRIZE WINNERS IN PAST CONTESTS

A Piano for $1.00. Surely people may enter your contests knowing that they will receive fair treatment. How glad I was to win a piano for so small an amount and wholly unexpected. The paper alone is worth all I paid.
MRS. L. W. NOTT, Marion, Ia.

He Won a Piano. Refer people to me if they want to know whether you are honest. I got a piano for a prize and never heard of you until I answered your ad. Your paper is worth twice the subscription price.
W. C. ELLIOTT, Audubon, Iowa.

$100.00 Prize. I got my $100 and it was the easiest I ever earned. The dots are hard to count but I know the prizes go to those who win them fairly.
AMY R. BARNES, Van Horn, Iowa.

Won $350 Cash. To Whom It May Concern: I won grand prize of $350 Cash in last contest. I was much surprised. I want to vouch as to Successful Farming's fairness to any and everybody.
JOHN A. GOODWIN, Richmond, Va.

$50.00 for Canada. Way up here in Canada I won $50. I never knew there was such a paper until I answered ad, now I will never be without it again.
MISS E. FORNIER, Mantane, Quebec

Won a Piano. I received the elegant piano which I won in your recent contest, and all was perfectly grand. I am recommending you to all my friends and you are at liberty to use my name as reference any time you wish.

The Papa Gontier Rose in California

AMONG ROSE GROWING COUNTRIES California stands pre-eminent. Nowhere else does the softening influence of a semi-tropic sun call forth such luxuriance of blossoms and perfection of form and color as in our own sunny clime. In this respect no section of our great state is supreme, for in all parts the rose is most truly enthroned as the "Queen of the Flowers" by the admiring tourist, whether he visit the lands frowned upon by the majestic Mt. Shasta or basks in the balmy zephyrs that are wafted inland from the Bay of San Djego.

There is no question but the determining influence in this magical development of bloom is superiority of climate. Rose plants are sent to us from all lands and it maters little what their "race, color, or previous condition of servitude," with us their blossoms simply "run riotous."

The original types of roses, those simple little single roses so familiar in the wilds of all parts of our country, have been culled and crossed with the wild roses from every land, Europe and Asia more especially, until the parentage of the present day advanced types is somewhat obscure; but we do know that from these humble types the glorious horticultural triumphs of the twentieth century have come and that the progress of rose breeding is still onward and upward, toward roses better in every respect than those that have held the public's favor in the past decade.

In this great work of plant breeding California is well to the fore and many are the victories over the forces of nature that are each year recorded for our growers, for it is not along the lines of least resistance that the most satisfactory development of the rose comes, and many, many thousands are thrown away ere one be found worthy.

Papa Gontier, though not far removed from the wild types in that it is semi-double, is nevertheless, well-nigh perfect in form, color, and general adaptibility, for it has been a grand rose for all parts of the Pacific Coast and considered equally good in many other countries. We have lately heard that a new rose called Lady Battersea is a marked improvement on Papa Gontier, but have not seen enough of it yet to speak with certainty. If such should prove to be the case, however, it will at once become a general favorite.

Orange Orchards

3 Years Old, Paying Big Profits

Located in the Best Citrus Fruit Belt in California

$125.00 per Acre

to secure a 10-acre orchard that will pay later on from $800.00 to $1000.00 net profit per year per acre.

Let us tell you how this can be done.

Coulson's Growing Chick Food

Is a mash feed for the growing chicks, designed for feeding when you leave off feeding Coulson's Special Dry Chick Food, composed of articles, each the best in its class, combined in the correct proportion to form

A PERFECT BALANCED RATION

It contains blood meal, meat meal, bone meal, and other articles rich in protein, and the other elements, and is the feed you need to make your chicks excel in size and weight and enable them to become strong, vigorous and heavy-laying fowls.

COULSON'S GROWING CHICK FOOD WINS OUT

San Marcos, Cal, July, 23, 1906.

Gentlemen:

I tried COULSON'S GROWING CHICK FOOD exclusively my first year in business on Brown Leghorns. I sold the cockerels as broilers at nine weeks, averaging 2 pounds, 3 oz. each.

I tried my own mixture of feed the next year and took the same care of the chicks, and sold 75 cockerels as broilers, weighing 105 pounds, making an average of about 1 1-4 pounds each.

Having tested at my own expense the two methods I have concluded that COULSON'S FOOD is superior.

(Signed) J. B. HOOVER.

Coulson's Special Dry Chick Food

Is acknowledged by all The Best and most Reliable Feed for Baby Chicks.

COSTS LESS THAN 2 CTS. FOR FIRST FOUR WEEKS

ONLY HIGHEST QUALITY GRAINS, ETC,, USED

Special Dry Chick Food contains numerous different seeds adapted to needs of the little chicks, besides meal, charcoal, bone and many other necessary articles, each in Granulated form making

A PERFECT BALANCED RATION

CANNOT PRAISE IT ENOUGH

"I cannot say enough in writing in praise of your Special Chick Food. It is just fine. I never saw chicks do so well before."

J. S. SCOTT, Madison.

PULLETS LAY EARLY

"I have fed your Special Chick Food and Growing Chick Food to all my stock with one exception. I tried one lot of 350, and fed them my way of raising chicks back East. Results just fair. The other were fed up to three months on your Special Chick Feed, and the results were a surprise to me. The birds were large and the cockerels out of one lot I sold to the California Market and got a big price, with the request to send on to them at any time I had more cockerels of the same quality."

Respectfully, A. P. WARD,
Calistoga.

USE COULSON'S AND BE SATISFIED

SPECIAL OFFER.

Where Coulson's Special Dry Chick Food cannot be obtained from local dealers, we will ship, freight prepaid to any railroad station in California, 100-lb. sack for $4.00, or 200 lbs. for $7.50, cash with the order.

Observations on the Liming of Soils

Based Upon Exhaustive Experiments Made During the Past Few Years at the Maryland Agricultural Experiment Station

By H. J. PATTERSON, College Park, Maryland.

THAT lime was one of the earliest materials used for improving the productiveness of the soil is evidenced by the writing of Pliny and Cato. It was used in this way probably two or three hundred years B. C. That chalk and marl were quite extensively used at an early period in Southern Europe is shown by the notes of Varro, taken during the march of his army to the Rhine. The contributions of Ruffin in the "American Farmer" as early as 1818, show that the agricultural use of certain forms of lime took a prominent place in the agriculture of the United States early in its history.

Although lime was thus used early in the history of agriculture, and has been used to a greater or less degree in all parts of the agricultural world ever since, yet the nature of its action on the soil is but little understood and has been but slightly studied. Almost every one recognizes the fact that there is a great difference in the action of lime on soils of different characters. That there is a difference between the action of limes of different character and composition on the same soil is a point seldom noticed.

Lime Used in Agriculture.

Good lime-stone contains from 50 to 55 per cent. lime (CaO,) and 40 to 45 per cent. Carbonic Acid. with small amounts of magnesia, silica, iron and aluminia. Such lime, when burnt, would produce the best quality of caustic or quick-lime, and would contain from 90 to 98 per cent. of Calcium Oxide (CaO.) Freshly burned lime, when removed from the kiln, will weigh about 90 or 95 pounds to the heaped bushel, and will slake about three bushels for one in volume.

Magnesia lime-stone, or dolomites, are quite varied in their composition, and may range in Carbonate of Lime from 20 to 80 per cent. and in Carbonate of Magnesium from 10 to 60 per cent. The average of such lime-stones used in agriculture, when burned, will produce a lime containing from 70 to 85 per cent. of Calcium Oxide and 5 to 20 per cent. of Magnesium Oxide. Magnesia lime weighs about 75 to 85 pounds to the heaped bushel, and will slake about two bushels for one, by volume.

Oyster shells contain 90 to 95 per cent. of Calcium (lime) Carbonate, and will produce, when burned, a comparatively pure lime, which should contain from 85 to 95 per cent. of pure Calcium Oxide if it has not been excessively contaminated with impurities and the ashes from the fuel in burning. Freshly burned oyster shell lime weighs about 60 pounds per bushel, and will slake out a little better than two for one by volume.

Quick lime is used at the gas works for removing the impurities of the gas. After it has been saturated with impurites, and no longer fit for use in gas making, it is sold for agricultural purposes under the name of gas-lime. This article varies considerably in composition, but consists essentially of the hydrate, carbonate, sulphate, sulphites of lime. The sulphides and sulphites of lime are injurious to germinating seeds or young and tender plants, so that gas lime should be applied cautiously, and when not too fresh. The action of the air on sulphides and sulphites changes them to sulphate of lime (gypsum or land plaster:) hence the exposure of gas-lime to the weather for some time improves its agricultural qualities. Average gas-lime contains about 22 per cent. water, 43 per cent. lime (CaC,) 21 per cent. Sulphuric Acid (Oil of Vitriol,) 8 per cent. Magnesia, and 6 per cent. insoluble matter. Of course this will vary considerably according to the character of the lime used, and the amount and nature of the impurities. The gas houses in Baltimore and Washington, D. C., use mostly oyster shell lime, and the gas lime from such lime would contain very much less Magnesia than indicated by the average figures. Gas-lime is usually sold at 65 pounds per bushel.

Gypsum or Land plaster is a combination of lime with Sulphuric Acid (Oil of Vitriol) forming sulphate of lime. It occurs in nature in large deposits forming beds of rock. These are comparatively easily mined, and the rock is ground to a fine powder for commercial purposes. It varies in color from white or yellow to gray. Gypsum or sulphate of lime is formed artificially in the manufature of phosphoric acid and phosphates, by treating the phosphates of lime with sulphuric acid, and a considerable amount of gypsum is necessarily used in agriculture in using dissolved bone and dissolved rock. Average gypsum contains about 32 per cent. Calciun Oxide (CaO.)

Chemical Action on Soils.

One of the most important chemical changes brought about in a soil through the action of lime is the decomposition of minerals, particularly the disintegration of refactory silicates. Such action as this would generally be produced more easily by caustic or quick-lime than by any other form. Lime materially aids in the formation of double silicates of alumina, which have an important influence on the fertility of the land. Double silicates of alumina may be described as silicates of alumina in which part of the alumina is replaced by lime, soda, potash or ammonia.

Most farmers are aware that ammonia is more valuable than potash, whilst potash is more valuable than soda and soda is more valuble than lime. The double silicates of alumina, when once formed seem to recognize this, and exercise a similar order of prefcrence. If a silicate of alumina and lime exist in the soil and should be brought in contact with soda, some of the lime will be given up and the soda will replace it, resulting in a silicate of alumina and soda.

The presence of the lime will not enable it to replace the soda, as the silicate of alumina prefers the soda to the lime. If, however, potash be added, the soda is given up and potash taken into the combination, because the silicate of alumina prefers the potash.

But if ammonia comes within the influence of this compound it will replace either the lime, soda or potash, and silicate of alumina and ammonia would be formed. These double silicates are in such shape as to be lost from the soil by leaching, yet are in a readily available condition for plants. From this it will be seen that it is desirable to promote the formation of double silicates, and caustic lime seems to have a decided action upon clays in starting and bringing about the formation of this most desirable class of bodies.

Combinations With Lime.

Lime has not only the effect of aiding in the formation of unions of potash which will be held in the soil, but it also has the ability to liberate potash from combinations which are locked up and unavailable to plants. This is particularly marked when lime is applied to land containing fragments of feldspar. Gypsum is particularly useful in rendering potash available, and the sulphate of lime in dissolved phosphates often have an indirect value in this way.

Lime also favors the production of nitrate of potash in the soil. This is particularly true when lime is used on soils receiving considerable stable manure. The process and changes involved are exactly similar to those which have been employed in many places for the production of nitrate of potash (Nitre) for use in the manufacture of gunpowder, and for which a prize was awarded by the French Government to Mons. Thouvenel in 1776.

Lime hastens the decomposition of organic matter and inert nitrogen compounds of humus in the soil, and promotes the formation of ammonia and nitrate compounds from the same. It also, as has been seen above, aids in the formation of compounds not easily removed from the soil. Lime promotes nitrifying ferments and makes possible their existence in many cases that would be impossible without its presence.

Lime produces particularly good results if applied after using green manures, as it acts chemically and unites with some parts of the organic matter and leaves the remainder in a disorganized condition which rapidly decomposes. It is, perhaps, this tendency to destroy organic matter that makes the frequent use of lime pernicious. All evidence teaches us that lime is no substitute for manure but only a reinforcement of it. No doubt much land has been reduced to the verge of sterility by applying lime continually until all the organic matter has been used up. Such procedure is probably responsible for the old proverb, "Lime enriches the father but beggars the son."

If a soil contains much phosphoric acid, combined with iron and alumina which is relatively inert, an application of lime will change it into a form available to plants. Lime applied to soils which have received or will receive applications of dissolved phosphates, will not produce any harmful results or cause a loss of the phosphoric acid. It may hasten the reversion of the soluable phosphoric acid, but the phosphoric acid will still be in an available condition. In the average soil this reversion takes place anyway within twenty-four hours after applying the phosphate.

Most cultivated soils possess a slightly acid reaction. This is generally due to decomposition of the remains of plants in the soil, forming organic acids. On wet soils this condition is more

Deciduous Fruit Culture

By J. W. MILLS

PEACH LEAF CURL.

PEACH LEAF curl is a fungous disease, the germs of which infect the trees in two ways. The spores from the fruit of the fungus fall upon the buds just as they open and of the weather is favorable to their growth, they sprout and the tree has the "curl leaf." This form is easily killed by spraying and if it were the only means of infection, there would be some hopes of eradicating it.

The myrlium form, is what makes it, so far as we know, next to impossible to eradicate the disease. The myrlium is that part of the fungous growth which grows within the tissue before the disease is visible to the naked eye. This might be compared to the underground root-stock of some plants that grow from year to year, but on which the top dies down into the ground each year. When the proper season comes around again, it springs up from below and if not killed will immediately spread its seed broadcast.

This form of the curl leaf lives under the bark of the leaf buds, and as the young leaves start, this myrlium grows into the tender leaf and the curled abnormal growth is the result. Spraying will not kill this inside growth that the fungus makes under the bark of the buds, but it does kill the spores that lodge on the leaves and that form is easily killed by spraying. This form causes most of the curl leaf, and while the other form contributes but slightly in a direct manner to the malady. It serves as a holdover that furnishes seed for a new crop.

Curl leaf is much worse some seasons than others and some varieties of peaches are practically immune from the disease. When the spring weather is very wet, with considerable cloudy weather, the curl is always bad unless prevented by spraying. Scientists explain that this is so because the sap flows into the trees with undiminished force, while the evaporation being much reduced, less of the water in the leaves is thrown off and thus they become more "sappy" and tender. This is the condition favorable to the growth of the curl leaf fungus. Thus it is that cool, wet springs are most favorable to the ravager of this disease.

Briggs Red May, Alexandria, Tuscan Cling and a few other varieties are practically free from the disease.

Several kinds of spray materials have proven effectual remedies for the disease. Eau Celeste is an effective wash if used when the trees are dormant, but will turn the foliage. For summer washes to catch any stray spores that may escape the winter spray, Bordeaux mixture is the best. Eau Celeste is made by dissolving 2 pounds of sulphate of copper (bluestone) in six gallons of water; add three pints of strong ammonia, mix thoroughly and make up to 45 gallons with clear water.

Perhaps the best spray is the lime salt and sulphur wash. This is made with 20 pounds of sulphur and 20 pounds of freshly slacked lime, boiled till it is well dissolved and mixed. This takes about an hour and a half. Add 20 pounds more of the lime and 15 pounds of stock salt and boil for another half hour; make up to 100 gallons. Use the material right out of the boiler as fast as made.

This material may be used with safety on deciduous trees as late as a week before blossoming time. In fact it may be used when the color of the blossom can be seen in the buds. It is not safe, however, to put off spraying so late when many trees are to be treated.

Fellow Passenger—Pardon me, your necktie has been sticking out for some time. I refrained from telling you sooner because those young ladies seemed so much amused.

Farmer—Thankee; an' the oil from that lamp has been dropping on that light overcoat o' yourn for the last ten minutes; but every one seemed so tickled that I hated to spoil the fun.—

The farmer whose son is a bootblack, believes in making hay while the son shines.

SPRAYING A TREE.

Quite as important as the material used is the method of application, for spraying must be done thoroughly, and it is false economy to be too saving of the spray.

Do the inside spraying first, and then, beginning at the top, apply the overshot or outside spray. Do not finish the sides and bottom until the top is thoroughly sprayed. The men should walk completely around the tree, and spray directly at it from all points. Do not try to spray around a corner. Before leaving any part of a tree the men should stand well back and spray the tips of the most extending branches.

The orchardist should insist on the tops of the trees being sprayed first and thoroughly. If the upper work is done well the lower branches will receive almost enough spray from the drip, and they can then be finished quickly, thus avoiding the greater drip loss which comes about through beginning at the bottom.

In summer spraying material should not be wasted on the trunks and large limbs free from foliage.

The Spraying Outfit.

Use a power outfit equipped with a mechanical agitator where practicable and maintain a pressure of 140 pounds or more. For large trees long extension rods should be used, as the tops can not be well sprayed without their use. The nozzles are also a matter of considerable importance, and the type varies with the character of the spraying to be done. Bordeaux nozzles are best when the spray contains coarse impurities, but for ordinary work those of the cyclone type are the superior.

The lime, salt and sulphur spray prepared by the old formula usually requires a Bordeaux nozzle, but the new formula, and the commercial lime sulphur spray, should be as readily run through long-distance Bean nozzles as are the summer washes. It is well to use a battery of two or three nozzles on each extension rod in order to increase the volume of spray handled by each man, for with a large volume of spray the time required to thoroughly spray a tree is much reduced, and hence the labor becomes less expensive.

Caterpillars.

The tent caterpillars are readily controlled by arsenate of lead, and no attention need be paid to them if the regular codling moth spraying schedule is followed out. Where this insect is to be treated separately use 1½ pounds of arsenate of lead to 50 gallons and spray lightly. Experiments this year show that apricot, cherry and other trees may be successfully treated for tent caterpillars by the use of this spray.—W. H. Volck.

SPRAY FOR CODLIN MOTH.

The First Spraying.

Use 2 to 2½ pounds of arsenate of lead to 50 gallons of 5-6-50 Bordeaux. Apply when the majority of the blossoms have fallen. That is from April 25th to May 10th, approximately.

The Second Spraying.

Use 1½ to 2 pounds of arsenate of lead to 50 gallons of 4-6-50 Bordeaux. Apply about the last of May or one month after the first spraying.

These two sprayings should be thoroughly applied, and will furnish the best possible protection against the attacks of worms and scab likely to occur at this period.

The Third Spraying.

Use 2 pounds or arsenate of lead to 50 gallons of water. Apply between the 10th and 25th of August. These three sprayings are deemed sufficient to control the codlin moth in the valley orchards.

In the hill sections, where worms are more abundant, the second spraying should be applied about the middle of May.

OLIVES FROM SEEDS.

Propagating olive trees from seed is very tedious, and requires extraordinary care. The pits are quite hard, often requiring from one to two seasons to germinate. The raising of olive plants from seed is the most natural method, and the one producing the most healthy and robust trees, the roots being more symmetrical; but as the plants make slow growth the first few years, a longer time is required to grow trees by this method than by any other. Trees grown from seed seldom produce fruit in less than eight years, and the plants must be at least two years old before they can be budded or grafted.

Those intending to plant pits should carefully select those from varieties having perfect kernels. It is not necessary that the variety from which the pits are taken for planting be one possessing high qualities for pickles or oil, because all fruits when grown from seed have a tendency to revert to the wild type, or become of a modified type, entirely distinct from the parent tree; but it is important that the tree be of a thrifty sort. Seed from dwarf trees should be avoided, as they produce plants of a still smaller habit.

The seeds, having been freed from the pulp, are washed in water containing some lye or ashes, to remove all the oil adhering to them; they are then washed in clear water, and, after drying in the shade, are mixed with moist sand and kept in a moistened condition till spring to be then sown. The use of lye is necessary to render the shell of the pit a little less compact, in order that it may be penetrated by moisture. The lye roughens the shell and thus gives access to humidity.

The sowing is done in February or March. As olive seeds do not all germinate the first year of sowing, it is advisable not to destroy the seed-bed until the end of the second year. Olive pits often continue to germinate in certain quantities for over two years. In order to hasten germination pits may be advantageously split by use of an iron vise. The longer part of the pit is placed between the jaws of the vise, and by turning the screw the shell is split. It is not necessary to take out the kernel; on the contrary, it is better to leave it in the cracked shell.

The seeds are sown in ordinary seed-boxes, with bottoms perforated to admit of good drainage. The boxes are then filled with fine earth (sandy loam) to within three inches of the top; the kernels are spread on top of this and covered with one inch of sand. The boxes are kept moist and shaded for awhile. This method obviates the necessity of soaking the pits in lye to deprive them of their oily coverings, and a person can easily prepare some six hundred or more kernels in a day.

FURROW IRRIGATION.

Fields and orchards are irrigated by furrows in many different ways. Usages that are suited to one locality may not be to another. Therefore any recommendations to apply this system to particular crops can be made only in general terms. With this in mind one may state that furrow irrigation is the best for the large majority of all orchards and for all root crops and vegetables.

It may also be adopted not only for the crops named, but for grain and forage crops when the available supply of water is small. The weak feature of this method, as now practiced, is the connection between the head of the furrow and the earthen ditch. The use of short tubes, or some other equally serviceable device, to divide the flow of the ditch equally among the furrows is strongly recommended. Were this custom made more general, it would greatly extend the area watered by furrows.

THE BORED BOARDER.

"I waited ten minutes for a car today," the landlady was saying, "and then it passed me without stopping."

It was afterward recalled that the habitually silent man had been having unusual difficulty with his chops.

"Perhaps," he remarked, "the conductor didn't care to have you board his car."

KUMQUATS IN FLORIDA.

A number of kumquats on rough lemon stock planted on rather moist ground have come under personal observation in which it was found that there was a more or less copious flow of gum from the region just above the union of the stock and coin. In all cases where this occurred it appeared that the cion was the only part affected. The trees were in an unhealthy condition. The diseased condition, if we may so designate it, did not appear to be mal-di-goma, though in some respects it resembled it. The trouble may have been due to the fact that the great foraging power of the roots enabled them to collect, in certain soils, more food than the less rapidly growing top could readily assimilate.

On the other hand, on soils containing less moisture and presumably less fertility, a number of trees budded upon rough lemon roots have been examined which were vigorous and perfectly healthy. If one desires to use the rough lemon stock for the kumquat on some soils the best plan would be to adopt the practice to insert kumquat buds in sprouts from rough lemon roots which already support and feed a sweet or mandarin orange top. A perfectly healthy union is secured in all cases as most of the food gathered by the roots is used by the larger and more vigorous top. Strange to say, however, the kumquat frequently outstrips the other top, sweet or mandarin orange as the case may be, in growth in height.

For the northern part of the State on most soils no stock is better adapted than Citrus trifoliata. Upon this stock it thrives and bears profusely, in four or five years forming a head as many feet in height. Regarding the stock used for the kumquat in China, Mr. Fortune, from whose remarks quotations have already been made, makes the following statement: The kumquat is propagated by grafting on a prickly wild species of citrus which seems of a more hardy nature than the kumquat itself. This fact should be borne in mind when the plant is introduced into this country; otherwise we shall have a comparatively hardy plant growing on a tender one." These remarks undoubtedly refer to Citrus trifoliata, the stock now so commonly used throughout Northern Florida for all varieties of citrus trees.

Sweet stock, on account of its susceptibility to the attacks of mal-di-goma should not be used. On some soils and in some localities the trees might continue to live and thrive for many years but there is no knowing at what time they may become diseased. The pomelo stock appears to be entirely free from mal-di-goma and it is well adapted to the kumquat.

BORDEAUX MIXTURE.

Fill the spray tank two-thirds full of water, then add the lime either properly slaked and strained or hydrated lime. After the lime has been placed in the tank start the agitator and add the required amount of bluestone which has been previously dissolved in water.

Continue the agitation for about a minute after the bluestone solution has been added, then place the arsenate of lead in the tank. The tank may now be filled with water.

Bluestone is more readily dissolved in hot than in cold water, but it should never be placed in and iron kettle.

FOR FIRE PROTECTION.

The offices and warehouses of Baker & Hamilton of San Francisco have been equipped with a system of fire protection for their own use. They have installed a rotary fire pump with a capacity of 400 gallons per minute against 280 pounds head-pressure. This pump is driven with their improved 25-horse-power Peerless Gasoline engine. It has been inspected and installed with the permission of the Board of Fire Underwriters of the Pacific. At a recent test it showed efficiency, and places them in a position to cope with a good sized fire. The water is pumped direct from the canal which gives them an abundant supply of salt water.

Mr. O. S. Wakeling, manager of the Engine and Pump Dept., would no doubt be pleased to show those interested in the installation of a similar plant for fire protection, the merits of the Baker & Hamilton fire-fighting plant.

A Noted Herd of Jersey Cattle

A great opportunity is now offered to secure one of the finest herds of Jersey Cattle, one which California has not seen in many a day. It is the famous

Gen. W. R. Shafter Herd

Which was gathered together without regard to expense, the only demand being **quality.** "Is she a doer as well as a good looker?"

In this herd, some bred originally by Shields, Pierce and other best breeders and later some by Gen. Shafter himself, are many prize winners. A detailed record of each animal will be sent on application.

The whole herd will be sold in a body if satisfactory bid is received by Aprll 1st. After that individual animals will be sold.

W. H. McKittrick, Executor W. R. Shafter Estate
Bakersfield, California

Contains all the money-making points of dairying. Among the subjects treated you will find How to Feed, What to Feed, When to Feed, What Foods Produce Most Milk, How to Take Care of Milk-Producing Foods, How to Feed Silage, the Care of the Milch Cow, and many other profitable and practical suggestions that help swell the profits of the dairyman. With the book we will send additional information telling you how and why you can get the most out of you milk by using the

Sharples Tubular Cream Separator

We guarantee that with a **Tubular** you can get 50 per cent **more** cream over the old pan method of skimming, and 6 per cent over any other cream separator made. Sharples Separators get **all** the cream and the **Tubular** is the easiest running, easiest cared for, and easiest kept clean. There is just one tiny piece in the bowl, the milk can is low and handy, the bearings are self oiling. Write for the "Business Dairying" at once stating number of cows you keep. Ask for booklet D.260

Mr. S. L. Boyer, Venetia, Pa., says "The Tubular makes me $255.00 yearly."

Live Stock and Dairy

By Mrs. Minna E. Sherman, Fresno, Cal.

THE HORSE.

THE inherited tricks of horses are often very amusing. My mare Pet, is a whimsical character. She is gentle, a good roadster, and while absolutely trustworthy, insisting on doing things her own way. Pet objects to be trotted through mud puddles. If the driver strenuously insists she goes but protests by giving vent to an impatient "unch" and a little twist of her head. I was driving her daughter, Bellwood, the other day, came to a mud puddle when she slacked up. I slapped her sharply with the rein, when out came the prostesting "unch" and the little twist of her head. She also repeats her mother's trick of holding up one hind leg threatening, and laying back her ears when anyone is a little slow in starting after getting into the buggy. The inheritance is mental, not physical, Pet is a low set black Morgan mare with high action, while Bellwood is a larger brown mare, with long swinging low action, from her Electioneer sire. The two have never been driven together, as Pet does not make one of a pair kindly. She will not allow the other horse to work up with her. The daughter, Bellwood, does not show this amount of ginger, but is an even-dispositioned all-around animal. Bellwood's filly, two and half years old, is being broken. I saw her standing with the same right hind leg up and ears laid back threatening to kick when kept waiting. I could fill a book with the stories of inherited mental tricks of the horses and cows on the ranch.

A Horse Hospital.

A well built room with a couple of box stalls, where a fire can be kept at night, is needed on every horse ranch. At present, we have two patients in the hospital; neither are seriously ill and both are glad when ever anyone drops in to see them. Dandy, one of the carriage span, has strangles. This is sore throat and produces choking in a horse. The first thing noticed is that the horse takes to slobbering. When driven it shakes the head and groans. When it becomes more severe, will plunge in harness. If the choking is bad enough it may throw itself in an effort to catch a breath.

The shaking of the head often deceives people into thinking that there is something in the ear. The danger lies in the secondary stage of the disease. If the horse is driven and becomes heated he will stiffen all over, and have to be turned out for six months or more to recover. There often seems to be so little the matter with them that the owner fails to realiez the horse is sick until this occurs. After the case has been treated it is rather a slow convalescence that follows, and with it heart weaknes may occur. The horse will often eat and drink well all the while he is really ailing. There is at times a slight cough that seems to be but a trifle.

Cure for Strangles.

When you hear the horse cough put you hand under the neck and feel along the throat, if sore he will flinch, and you have located the trouble. The domestic remedy is cloride of potash. Take a teaspoonful for a dose, mix with molasses, and put on the back of the tongue with a wooden spatula; poultice with bran, or if acute, with mustard followed with a hot bran poultice. The poultices can be applied easily if long stockings are used to hold the heated mass. By alternating two poultices of bran, making one hot while the other is on, the trouble can be reduced quickly. This is the plain treatment. The veterinarian gives medicine to stimulate the heart as well as to help along the throat part. I like their simple way of giving the medicine in fluid form, squirt it with a syringe on to the tongue.

The secret of curing strangles is care and nursing. It is merely a severe sore throat that has a croupy choking in it, for I never heard of a horse even after throwing himself that choked to death.

A Surgical Case.

The other patient, at present, is a mare, "Midnight," that skinned to the bone both of her fore legs by trying to climb over a watering trough. I might as well say that Midnight has not a happy disposition at all, and tried to drive away Sweetheart, a little trotting mare. What Sweetheart lacked in size she made up in activity, and the result was Midnight got the worst of the fight. This is a case to be treated with moist surgical dressing. After three weeks all is healed except a tiny spot. The wounds were thoroughly irrigated with warm water with carbolic acid in it. Each day it is washed with warm water and creolin is rubbed on it with a little bit of cotton, then bound up with cotton and creolin.

Three years ago when we had the screw flies here, this mare could hardly have been saved. This pest was brought from Texas, and the slightest abrasion on a horse or cow was quickly filled with maggots, resulting in terrible swellings and sores, from a very slight wound. Fortunately, after three years of these torments to the poor animals, the hot weather of three years ago, with the intense dryness, proved too much for them, and they passed out of the valley. The need of quarantine is certainly great on all pests; these are as undersiable tourists as many of the Orientals now pouring into California.

Introduced Pests.

When I look back, (it is not a good thing to do I admit on the past twenty-one years, for I have ranched here that long, I see the long string of things that the East has sent us to the detriment of our fruit industry. The codlin moth, the pear and peach blights are all from the East. Still the nurserymen are bringing in peach trees fromt he East, and we will have the yellows and rosette both before long. Think of the days only a few years ago when the fruit had no worms, when there seemed to be no disease anywhere. Why! You could hardly kill a horse or cow except you struck them in the head with an axe.

The pastures long used on a ranch should be turned over and sown to grain for a year or two, and then they can be pastured again with immunity. The time is coming fast now when the land will need this changing off as the orchards and vineyards are hard on the land. It will pay well to plant the pasture to fruit and make pasture of the fruit land for a term of years, or plowing and cultivating crops on them. This I believe will come in to control the fruit pests. Fortunately the same ones do not attack the grass and cereals as they attack trees and animals.

COOLING WITHOUT ICE.

"For two years," says a practical dairyman in an exchange, "I have kept the cream from ten cows in first class condition without ice. In the corner of my house cellar, near the drain outlet, I built a platform 3 feet high and 3 feet square. I nailed to the sides burlap sacks so as to hang to the ground. On the platform I placed a half barrel with a hole to take in a hose pipe, which I ran to a pail in the sink where we pump water from the well, and fill the half barrel with water. I place the cream cans under the platform, and by several small gimlet holes let the water onto the top of the cans. This forms a cold storage chamber, and I think it is equal to the tank of water with ice in it to keep the cream. The cream gatherers say my cream has been in as good order as the best."

FEEDING FOR MARKET.

With a spring farrowed pig to be converted into money before Christmas a day without gain in weight is a loss to the owner. The means of securing maximum gain at minimum cost will vary greatly. With hogs to be satisfactorily marketed at the above mentioned age, the best of pastures are not of themselves sufficient. To have the grain appetite well formed before weaning, the use of soaked shell corn in a pen from which the larger animals debated. Such mill feeds as rice polish wheat and oat shorts fed in a not too thin slop are excellent for young pigs, whether fed direct or through the suckling dam. Given a good alfalfa pasture and cheap corn a young pig will go on well. The cool green feed is too bulky to render an additional thin slop advisable, but puts the system in such a condition that the entire nutriment of the corn is returned as gain. It is at about this stage that the troubles from worms are likely to manifest themselves. To any one familiar with the indications of worms it is a good investment to sacrifice one of the runty, dry-haired, pitiful looking ones that gets thinner each day, no matter how much they eat. The examination of the stomach of such a pig will impress the possibility of its being possible for a young pig to have within him worms of sufficient size and number to actually utilize the total digested substances, leaving the animal to literally starve. There are many good worm remedies on the markte. The calomel and santonine mixture is affective though somewhat troublesome to administer. Than worms there is no other trouble that does more to hinder growth and favor disease. In a large bunch of young hogs there are always a few that need to be put by themselves until they are able to hold their own in the herd.

HOG ANCESTRY.

The best possible start a young pig can have is the heritage of good ancestry, says Prof. Marshall. Judicious management may, in part atone for its lack; injudicious management may in part nullify its influence, but good birth and good care make a combination which alone is safe to tie to in these days that bring hogs raised from all parts of our country to common buyers through different points, making it possible for the more favorable climatic and seasonable conditions of the southwest to aid in settling the price of the corn belt hog.

In many parts of the west it is still profitable to handle hogs somewhat the same as steers; that is, they are turned out and allowed to roam until they have attained sufficient size to be put up for fattening. This system gives a cheaply made animal but does not argue that by use of forage crops and exercise of more care, a greater number of hogs could not be so handled so as to produce many times more profit from a fraction of the land.

The following list shows the purchasers of Registered Holstein-Friesian bulls from the last report:

California Boy of Riverside, Cone Ranch Company, Red Bluff. Hengerveld Lass Paul of Riverside, C. E. Miles, Newman. Jetze Boy of Riverside, Dixon & Chase, San Jose. King Jetze of Riverside, Oliver Orr, Gilroy. Fedora of Sleepy Hollow, Feibia Paul, Ficedes, Fiction, Fidessa Majoram, Fidorence. Folleen, Johanna Witsend, Julia Hengerveld, Beauty, Legendary Tirza, Legend Suzanna, Mapessa, Mojeska Crane, Nadgy Korndyke, Salambo Korndyke, Selma, Witessa, Yonda Fidessa, Zampa Korndyke, registered Holstein-Friesian cows, have been sold by R. M. Hotaling to J. H. Harlan Company, Woodland.

Cantate Korndyke, Erka Korndyke, Fidessa Nudine, French Rolls, Helta Fidessa, Jessocrane, Pekora, Holstein cows, were sold by H. A. Hotaling to W. O. Russell, Davisville, and Kate Crane, Lady Dora Crane, Ora Colantha, to F. Vile, Gelroy.

Eighteen hundred English walnut trees are to be set on the Auburndale tract, northwest of Corona. This is the first acreage to be set to walnuts in this vicinity nearer than Temescal.

MARKETING PIGS.

If pigs are to be marketed at eight months they may be allowed an acre of alfalfa to 15 or 20 head since the feed requisite for early maturity will preclude their grazing as extensively as they would if no grain were fed. For feeding on alfalfa pasture corn at a reasonable price is an excellent food. There is no time to first grow and then fatten a hog of spring farrow that is to make payments on the first of January; growth and fattening must go on simultaneously and these feeds combine well to supply the needs. On oats or sorghum pasture a larger allowance of grain is necessary and one that contains more elements of growth. Three four-acre pastures would be preferable to one 12-acre pasture for raising a carload of hogs, since they can be changed from one lot to another so as to always have clear, fresh ground to run over, which is very important in any season and especially when disease exists in the vicinity. Just what effect the feeding of salt mixed through charred corn cobs has upon the system we do not know, but the growing pig likes it and if he can depend upon always finding a supply near the feeding ground will appreciate it though not consuming large amounts. Soft coal allowed to soak in water a few days is also relished and probably answers the same purpose as the charcoal.

The amount of grain to be fed will be regulated by time at which it is desired to market. North Texas farmers who run fall farrowed pigs on winter wheat give from one to three ears of corn night and morning until the hogs weigh 150 pounds, at which time they are yarded for finishing. Others who finish on alfalfa in spring and early summer increase the grain and allow the hogs to pasture at will to within three or four days of shipping.

Sorghum, oats and wheat pasture are good and keep the system in fine condition, but do not produce the real gains that alfalfa and rape do. Rape, however, in the southwest can not be relied upon for warm weather, but is an excellent winter pasture and will stand considerable frost if allowed to get a good start before cold weather comes.

The peanut crop is coming to be a very important one on light soils but should be regarded more as a finishing than as a forage crop. It is possible to have peanuts for the hogs to harvest from August to February and March. One acre of peanuts, the Alabama station says, will furnish food for 25 half-grown hogs one month.

In using this crop on a farm of diversified operations young hogs may be kept on alfalfa and very light grain unless very early maturity is desired, until time to turn on peanuts. Then allowing them the run of the peanuts in small lots, preferably divided off by movable fences, the alfalfa may be cured and harvested for feeding to horses or cattle.

With the possible utilization of green crops and cheaply grown finishing crops, all produced on low-priced land, there is no section that can compete with the southwest for lowness of cost and safety of pork production.

The demand for high class coach and draft horses far exceeds the supply, and these conditions will exist for a long time to come. Horses of this type are bringing top notch prices and those breeding such stock are sure of a good market for years.

The breeders of horses on the Pacific Coast will be interested and pleased to know that California has been fortunate in securing a branch stable of one of J. Crouch & Son of La Fayette Ind., who are now recognized as the largest importers of German Coach, Percheron and Belgian Stallions in America. They have located their California Branch at the State Fair grounds, Sacramento, and have on exhibition some of their finest importations, and will take pleasure in showing their stock through their manager Mr. J. F. Campbell, who will explain the terms and guarantee on which these magnificent horses are sold.

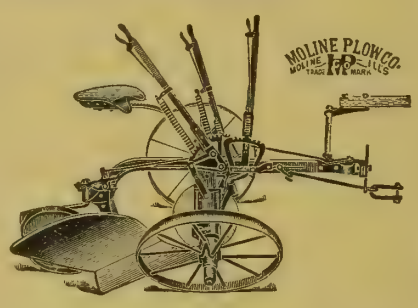
30,000 FARMERS

Bought Good Enough Sulky Plows

last season. Since its introduction the sales on this tool have increased rapidly from year to year until last season it required, in round numbers, 30,000 to supply the demand. This ought to interest a man who is going to buy a plow. It means that after due consideration 30,000 farmers agreed that the Good Enough is

"THE BEST PLOW ON EARTH FOR THE MONEY"

A MOST DESIRABLE AND ECONOMICAL FEATURE IS THE EASE WITH WHICH BOTTOMS OF DIFFERENT SIZES CAN BE FITTED TO THE SAME BEAM.



The Good Enough is extremely simple. It has the desirable features of up-to-date and high priced sulky plows without the complicated construction of the very high lift type. The land axle has a yielding spring—uneven ground does not affect depth of furrow. **Turns square corners either right or left.** The landing lever and swinging clevis permit the operator to change the land of the plow instantly without stopping the team or leaving the seat. It is furnished with pole attachment when ordered. Made right and left hand. Sizes from 10 to 18 inches. Bottoms for every condition. Will plow any soil that can be plowed with a moldboard plow.

Wheels Have Removable Hub Boxes---DUST PROOF, OIL TIGHT

THE GOOD SHEPHERD.

Providing a person about to embark in sheep keeping were to inquire what would be his first essential in making a start in that industry, I should answer, "Develop a kind and patient disposition." In reality, it is practically useless for a man possessed of a hard heart and cruel temper to pay long prices for blooded stock or short prices for culls. He will succeed with neither, in case he gives the flock his personal care. The sheep, being a nervous, timid creature, cannot thrive under abuse. From the earliest history of man the word "shepherd" has stood for the meaning of gentleness and tenderness. You will note many places in the Bible where this world is used in reference to this very meaning. Shepherds, taken as a class of men, from the time of Abraham to the present day, average as great-hearted, whole-souled, trustworthy individuals, men you may rely upon and safely appeal to when in case of need or trouble. Why is this? It is this: The sheep is the most helpless of all our domestic animals, being the prey of many diseases, countless parasites and are ravaged by wild geasts. It is the watchful care, nursing the sick sheep or starting the new-born lamb upon life's journey that softens the heart of the good shepherd, "for he loves his sheep." This rule does not only apply to sheep, but to all dumb animals trusted to our care. The man who wins the purple and blue in the show ring, you will find, is the man who treats his stock as they should be treated, with kindness. Stock will ever respond to kind treatment; it is the best "feed" you can give them. The nervous strain of fear is a serious obstacle to their well being. The person whom nature has blessed with a kind heart, or he who has developed this disposition by his own strong will power, such a man will succeed in the sheep fold of this world and succeed to the "sheep fold" of the one beyond.—H. H. W.

WHAT IS A COW WORTH?

What are the cows worth that produce 400 pounds of butter per annum? Here I am going to make a statement and undertake to prove it correct, says H. B. Gurler, De Kalb county Illinois, as quoted by Hoard's Dairyman. When a cow that produces 200 pounds of butter per annum at a food cost of $39 and a labor cost of $12.50 is worth $35, the cow that produces 400 pounds of butter annually is worth $400, and the owner can make net $16 more from her after paying interest on the $400 than he can from the cows that produce 200 pounds of butter.

There is no more labor connected with the 400-pound cows than there is with the 200-pounds cows. The price at which butter has been credited, i. e., 20 cents per pound, is the net price from the creamery after the making has been paid for. In this herd the increased cost of feed for the 400-pound cows was more than offset by the increased amount of skim milk, so we have the 200 pounds increase of butter as net profit over the 200-pound cow. Two hundred pounds of butter at 20 cents is $40. We have $400 invested in these cows which at 6 per cent. interest is $24, which we will deduct from the $40 and we have left $16 to the credit of the 400-pound cow.

A Rare Opportunity.

A little over a year ago, the writer had the pleasure of sitting beside Gen. W. R. Shafter in his buggy, and driving over his ranch, while the General enthusiastically pointed out the good qualities and beautiful lines of his fine herd of Jersey cows. As we drove through the fields he incidentally pointed out the old war horse which carried him through the Cuban campaign. But his real pleasure was in referring to his fine cows. As will be noted in another column, this fine herd is to be sold, and it offers an opportunity which will compel Jersey breeders to sit up and take notice.

In the herd are many prize winners at California State Fairs, which, combined with the fact of Gen. Shafter's great care in selecting them, will give an added value which is worth serious consideration.

Write Mr. McKittrick for a detailed list of their animals.

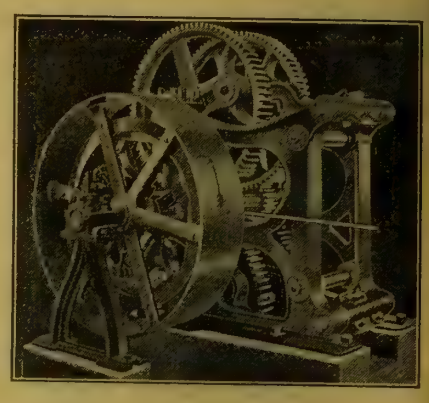
The Pomona Pumps Are Best



for City Waterworks and Irrigation

BECAUSE—

Using machine cut and slow running gears, they are

PERFECTLY NOISELESS.

They use stepped gearing with no break in the tooth contact, doing away with all rattle and vibration.

BECAUSE—

They have an ideal motion of the pump rods, which consists of a uniform continuous slow up motion, a smooth, quick down movement with absolutely no jerk in starting the rods upward eliminating all rod breakages and valve troubles.

BECAUSE—

They will save you money in cost for power. We use machine cut gearing which alone saves ten per cent. We have a leverage in our gearing which other pump makers do not have and which they do not tell you about when trying to down us.

BECAUSE—

In pumping through long pipe lines, they deliver a continuous steady stream.

They do not hammer out your pipe line by irregular pulsations of the water column.

They save power by keeping the water in continuous motion.

BECAUSE—

They are fitted with improved oiling devices that can be filled without stopping. Pumps may run for weeks continuously.

BECAUSE—

We have advantages in our pumps that investigators appreciate at once, consequently, where one goes others follow and we are fast taking the country.

BECAUSE—

We give a guarantee of satisfaction with every plant.

The Vegetable Garden

By ERNEST BRAUNTON

SAVE THE RAINFALL.

STIR THE soil in the garden as deeply as you can, and do it at once, so that you may have a deep reservoir to hold the rainfall. By catching it in a deep basin it will be prevented from running off and consequently will soak down to a considerable depth.

Such a supply of soil moisture will last a long time if proper means are taken to prevent evaporation and if a comparison is made with a plot of unprepared land it will be seen that the latter will need about two good irrigations before the prepared land needs any and yet will never, throughout the whole season, prove as resourceful or drought-resistent as the more deeply plowed soil.

Land that has a hard surface, is sloping, and has no winter crop of weeds or other vegetation, will prove a poor place for any crop.

Not only should the land be deeply plowed, but toward the end of the rainy season, which is now, the surface should be kept stirred to prevent evaporation of soil moisture for the bright, sunny days which we are having at the present writing, will soon rob the soil of its water content unless evaporation is checked by a soil mulch to break up capillary connection between the soil bed and the surface air.

What has been said above regarding the garden is equally true of the largest field, no matter what the contemplated crop. In our semi-arid clime, this evaporation is much greater than occurs in any section east of the Rockies, except possibly portions of what is known as the "Great American Desert."

CARE OF GARDEN SOILS.

There is no one point upon which our people more commonly err than is supposing that any piece of mellow land, suited to trucking, but not rich, can be made at once to produce a paying crop of vegetables of all kinds by the excessive use of fertilizers upon it. While such crops as the English peas may be produced on such land, the man who would undertake to grow a crop of early cabbage on it would be pretty certain to fail to get a paying crop.

No matter how good the soil is for the ordinary farm crops, it will not be in condition to give the best results in garden vegetables until after good culture and heavy fertilization. And while the commercial fertilizers contain all the elements of plant food that stable manure has, and in better proportion, the vegetable matter in the manure not only has a good mechanical effect on the land, but it keeps up The commercial fertilizers lack this, the formation of nitrates in the soil. and the lack must be supplied if we keep up the productiveness of the land. Decomposed vegetable matter, especially leaf mold will do this, but this is an expensive thing to collect and haul.

The most rapid and economical way in which the vegetable matter can be gotten into the land is by the growth of some leguminous crop on the land. For this purpose there is no crops better than vetch by reason of its rapid decay. This plant, in common with all the pea family, has the power of capturing the nitrogen from the air and fixing it into the soil for the succeeding crop. Its heavy growth above ground, the greater part of which, too, comes from the air, furnishes a larger amount of vegetable matter than would be gotten in the heaviest dressing of manure.

The plant gives the California gardener a great advantage over those in a colder climate, because it can be grown after his early crops are shipped, as a preparation for his winter ones, and he can thus do as much in the way of supplying his soil with organic matter and nitrogen in one season as the other man can do in two, and can at the same time raise a valuable forage crop, for as the soil becomes well stored with vegetable matter we do not think that it is advisable or economical to bury the whole growth.

The growth of tops will be of more value for feeding stock, and by careful saving of the manure he can return to the soil nearly as much of manurial value in a much more available condition. The keeping of dairy cattle in connection with market gardening is thus practicable and profitable. The manure thus made is also a great help in the saving of commercial fertilizers. Whenever there is a ready sale for dairy products it will always pay to keep cows for the consumption of the forage that can be grown so heavily on these lands, and to use the utmost care in the saving of all the manure.

POTATO SCAB.

"J. A. S.," Lompoc, sends in a potato affected with scab and several enquiries reach us this week regarding this trouble also asking what it is and how affected by the prescribed treatments.

The effect of corrosive sublimate n preventing scab will be made plain when we understand the cause of scale to be a minute microscopic plant which penetrates the skin of the potato, lives on the substance of the tuber and matures its seed there. When scabby potatoes are planted without treatment, the seed of the fungus is also planted, and with the new crop of potatoes an increased crop of the fungus is produced, until the market value of the potatoes is almost destroyed.

It has been found that a bath of the seed potatoes in a solution of corrosive sublimate kills the scab fungus, and if the soil has not had potatoes grown upon it recently, the new crop will be quite free from the disease.

Take three ounces of corrosive sublimate and dissolve in ten gallons of water, using a barrel that you do not use for any other purpose for the solution. Put what seed potatoes this water will cover in a thin bag, and let them remain in the bath two hours. Some have treated seed sufficient for two acres with renewing the strength, and it was entirely effective. Some planters cut the potatoes before the bath, sometimes after, without any difference in results. Do not forget that corrosive sublimate is a poison. Keep the treated potatoes and the barrel containing the solution out of the reach of animals.

POTATOES IN AUSTRALIA.

Potato land is usually ploughed twice, and the early seed planted to a depth of 4½ inches. The crops are generally dug before the stalks have withered, or any hot weather experienced to injure the tubers. With the later crop, however, an extra inch in depth, or 5½ inches, is made for the seed in order that a good covering against the hot February sun may be secured. Rows are sown 28 inches wide, and sets planted from 18 to 20 inches apart.

The crop is usually drill-harrowed three times; on each occasion the implement is fitted with different tines. When the plants appear above the ground a drill-harrow is used, then hand-hoed between. The second drill-harrowing, as well as repeating the former operation, puts a little earth up to the stalks, and the last harrowing is done as the rows are about to close. With hoeing, weeding, and hilling-up, cultivation operations are completed, and a clean, healthy and attractive-looking crop is the result.

PREVENTION OF ONION SMUT.

The remedies are dilute solutions of formaldehyde, commercially known in 40 per cent. strength as formalin, sprinkled upon or sown with the seed, and applications of ground quicklime, applied to the soil just previous to planting. The results appear to be entirely satisfactory.

By J. W. MILLS

ORANGE SEED BED.

JUDGING from the number of queries that come in regarding the propagation of oranges stock from seed, there will no doubt be a surplus of seed bed stock in another season. This subject was treated in these columns a short time ago.

Seed is best taken from the fruit by first allowing the orange to rot. Place the pulp in a sieve which will not allow the seeds to pass through and wash the pulp through with the garden hose.

Prepare a seed bed by sifting the soil to remove stones. Make this seed bed at least a foot deep; 18 inches is better Fill in the bottom six or eight inches with soil mixed with equal amount of well-rotted manure. Cover this with good sifted soil to the surface of the ground and settle well by flooding; when dry enough to work well, hoe it about one inch deep, level up with a rake and firm it well with a board. Make trenches half an inch deep and six inches apart. In these, place the orange seeds so they will nearly touch and cover half an inch deep with sand. Stretch burlap or cheese cloth over the seed bed and sprinkle every day just enough to keep the surface damp. When the seedlings have about four leaves on them, uncover at night, before sundown, so that they will receive a little sunshine. Cover them again soon after sunrise so that the hot sun will not scald them. During cloudy weather it may be left off all the time. Gradually extend the time of leaving the cover off till the young plants become accustomed to the sunshine.

During extremely hot days during the summer, the covering should be left on. Late in April is the proper time to start the seed bed.

The plank should not be removed from the seed bed till the following spring and they will need protection during cold nights. Nearly all orange seed beds are made under lath houses, but even with the best of care the loss from damping off is heavy sometimes and when this condition becomes apparent, the damage is done and there is no help for the young plants. We have never seen damping off in the seed bed when the plants were grown in the open and the sun allowed to strike them early and late in the day at the beginning, with a gradual increase of the full sunshine.

The young trees should be transplanted with the nursery when they are a year old and after the soil warms up in the spring. The trees should be planted about one foot apart, in rows four feet apart.

TANGERINES AND MANDARINS.

We were asked the other day to explain the difference between a Tangerine and a Mandarin orange. We couldn't do it. We never heard but one man attempt to explain the difference and he got so badly mixed up that we never had the courage to try it. The names Mandarin and Tangerine seem to be given to varieties with slightly differing qualities, but these qualities may be found in either of the supposed types.

This type of orange is the Kidglove, so called because the rind is so loose that it may be removed without soiling the gloves. It is quite a favorite for the home orchard in its season, the flavor being distinct from the Washington navel or the ordinary sweet orange.

It is not grown on a large commercial scale, though small plantations of them have given good returns.

It is not an easy orange to handle as the rind is very thin and easily broken. For this reason it is shipped in half-boxes. While the demand in the market for this orange is limited, it is very desirable to have in the collection of home fruits.

Said a man in a spirit of pique
To his wife, "in that hat you're a frique!"
"Sir, you'll see how it feels
To get your own meals,"
Cried his mate. "Ta-ta for a wique!"

Gas from cocoanut oil is being used in the Philippines.

ARTIFICIAL HARDPAN.

If the surface layer of six or eight inches which is supposed to be kept mellow by cultivation, should remain unmoved at all after irrigation, we would expect it to become hard as it dried out and this drying hardening process would go on to increased depth till water was again applied, and then the water would penetrate the hard surface but slowly.

If this application of water should be repeated at intervals without stirring the surface earth in the meantime we would have hardpan surface and the water would finally flood off from instead of being taken into the ground.

Now, if the upper few inches should be stirred but imperfectly or not to a sufficient depth, the drying hardening process would yet go on in the stratum immediately below, in a lesser degree than it did at the surface, but as certainly, till water was again applied.

You readily see that if this sub-stratum is allowed to become dried and hard, it wil not only take more water to saturate it at the next irrigation, but since water percolates faster in moist soil, it will take it less readily than if it had remained in a fairly moist condition from the former irrigation, and more water remains in the surface stratum, where it is not wanted. And because of this substratum being less well saturated, unless better protected, it dries out and hardens the more before the next irrigation, and this process continued results in the more or less well established, troublesome layer which we call hardpan.

FLORIDA FROSTS.

The late cold wave was peculiar in many respects. It inflicted more or less injury in apparently the most capricious manner. Adjoining citrus groves show a wide difference of results, one not shedding a leaf, while the other is nearly bare. Even some trees are stripped on one side and untouched on the other. The same grove will show trees seriously affected, while many standing side by side with them do not exhibit a sign of damage. Localities in the same latitude, lying east and west from each other, show the widest variation. It is the general opinion that the cold came in streaks, however, such a thing may be posible. A line drawn from north to south through eastern Hillsborough, Polk, Manatee and DeSoto counties would center the worst hit neighborhoods.—Tampa Times.

ORCHARD IRRIGATION.

To those who have practiced it, it seems amazingly strange that the methods of placing the water as near as possible to the root bed by deep furrows should be of slow growth in general practice. The amount of expensive water evaporated from wide shallow furrows, added to what they needlessly deposit in the surface stratum, to go into the air later on makes up an enormous wastage that may be largely prevented. Yet every day during the long summer you see this wastage going on over thousand of acres. But this direct money loss in water is a minor part of the real damage. A good irrigation is pronounced, because a wet surface is produced; but really the root bed has been robbed of the moisture absolutely required to keep trees vigorous and develop good fruit.

IT'S PENNY WISE.

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for $1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 2124 Willow St., Los Angeles.

At eve it rains a lusty dew,
And in the morning it isn't through;
At noon it rains a regular pour,
And then at night it rains some more.

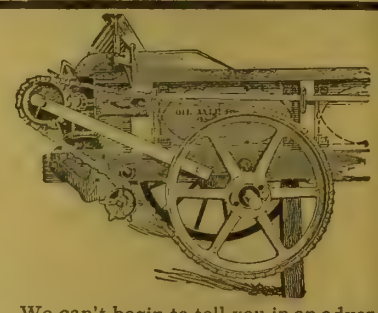
IRON AGE

Implements are the best garden tools made and the biggest money makers. You need one.

Wholesale and Retail Wagons, Carriages and Implements

Newell Mathews Co. 200-202-204 No. Los Angeles St., Los Angeles, California

This is Where the Hard Work is Done



and this is where some spreaders give you trouble. It's easy enough to build the front end of a spreader—the front end is a *wagon*; the back end is a *machine*.

In SUCCESS Manure Spreaders

28 years' experience insures no trouble at the business end. Twenty-eight years has eliminated the trouble-making things.

We tried gear drives—they won't do. We saved you the trouble of trying them.

We tried smaller axles—they won't stand the strain.

We tried all woods for the frame and have settled on second-growth white ash.

Look at that cut again—See the heavy iron brace from the beater end to the driving axle. It removes all strain from the end of the body and makes the cylinder run freely without binding.

See the big driving wheel and the chain—that's a steel-pin chain—the only kind that will work satisfactorily.

We can't begin to tell you in an advertisement all the good points in SUCCESS Spreaders, but when you get ready to buy a spreader do three things.

First—Write for our spreader book. It tells plainly and truthfully about SUCCESS Spreaders. It will start you right in the selection of a spreader It will be a standard to guide you in examining others.

Second—When we send the catalog we tell you who sells SUCCESS Spreaders in your locality. Go to that dealer and see one. Examine it thoroughly Compare it with others.

Third—And most important of all—Go to some man who has used a SUCCESS for a few years and ask him what he thinks of it.

Do this and you will have Success with your manure spreading

WITH A SIEVERT OIL BURNER

You can burn 100,000 cubic feet of air with every 130 gallons of oil this means perfect combustion. To burn more than 100,000 cubic feet of air with 130 gallons of oil, there is a decided loss of heat To burn less than 100,000 cubic feet of air there is a loss of fuel. The only safe and reliable burner on the market. Send for full particulars.

SIEVERT OIL BURNER CO. 1001 No. Alameda St., Cor. Main and Ord Sts., Los Angeles, Cal.

When writing advertisers, mention Cultivator.

BENEFITS OF CULTIVATION.

Cultivation is beneficial in the following ways: It increases the water-holding capacity of the soil and conserves moisture, both by allowing rain to sink more freely into it and by checking evaporation. It pulverizes the soil and allows the air to penetrate, thus supplying oxygen to the root.

In cultivated soils, decomposition and nitrification go on more readily and if the materials are present from which nitrogen can be formed, its formation takes place more rapidly than if the soil be left uncultivated.

Most of the moisture in tillable soil is held as a minute film surrounding the soil particles. It necessarily follows that the more numerous the soil particles in a given space, i. e., the smaller they are, the greater will be the water-holding capacity of the soil, because the total surface area of all the particles increases as they are reduced in size.

And it is true, within certain limits, that the water-holding capacity of a soil increases as the size of the particles diminishes. If, however, the particles become too small, they may become too closely packed, and thus this object of cultivation will be defeated.

The size of the particles can be reduced by cultivation by breaking up masses which may have become more or less cemented together, and the water-holding capacity thereby increased.

The opening and loosening of the soil permits the rain to penetrate. If the surface of the ground becomes hard and compact, the water will run over the surface or collect in puddles and disappear by evaporation. In either case the loss will be great. But if the soil is well stirred and loose, the water will enter.

Once it is safely beneath the surface, it is necessary to keep it there; it has gained entrance by a passage through which it should not be allowed to escape. The water will again make its way to the surface by capillary attraction, passing upward through the minute spaces between the particles of soil. If these minute tubes or passages extend right to the surface the water rises to the top, comes out, and is carried away by evaporation.

Frequent, shallow cultivation will prevent this escape of water, by breaking the capilary tubes. The top earth is stirred, it parts with its moisture and becomes quite dry. Then it acts as a dust blanket and the great amount of moisture below is not allowed to reach the surface to be carried away by the moving air above.

REDUCING HARDPAN.

Deep, thorough, persistent irrigation and cultivation will subdue the most obstinate cases, except when formed by the cementing process. Modern medical science has found means of saving life and limb in many cases by less harsh means than the cruel knife. So with modern irrigation and cultivation. I am firmly in the belief that the deep cutting subsoiler should be abandoned. But there is another way and a better, because it saves this serious sacrifice.

In preparing for planting, see that the entire surface is thoroughly plowed fifteen inches deep—twenty would be better. After that the orange tree root-bed need not be disturbed by the plow, and by proper care nine-tenths of the hardpan layer, so damaging to the feeding roots, need not occur. Of this root-bed the location and character of which I have tried to keep before you, I heartily command a more careful study than has yet been given by most orchardists.

CITRUS TREES

TRUE TO NAME

And embracing all the standard sorts, are to be had of our establishment. Bear in mind that we are the largest growers of Citrus Trees in the world, and that our stock has been awarded the gold medal at every world's fair in the world where we have shown. Our fine booklet, containing 50,000 words and over 100 illustrations, gives you all the points on Citrus Culture. Price 25 cents. Can we send you a copy?

San Dimas Citrus Nurseries

San Dimas, Cal.

R. M. Teague, Prop

Save Your Fruit From Frost

Be ready to meet the first cold snap and protect citrus fruit and vegetables from frost. You can be protected by using Geo. Griffiths' Heat and Smudge Fuel (patented). Not only crops saved but trees kept from injury. Others did it last year, you can do it this.

One grower saved thousands of dollars by using this fuel, while neighbors who did not use it lost crop and had trees badly injured. One ton per acre will answer for three nights' burning.

Order now and have fuel on ground for immediate use, if needed. Loose fuel in sacks $9 per ton f. o. b. Los Angeles; Briquettes, $12. Stoves good for 8 years, 50c each. No oil or kindling needed.

HILL'S FARMS.

Of particular interest is the article from J. J. Hill, the great railroad president in the Current Century, on the establishment of model farms, conducted by the National Department of Agriculture. Mr. Hill, as every one knows, is a practical farmer and his education has been gained from the soil, as well as from the lore of agriculture writers.

Mr. Hill's idea is to have a model farm in every county in every state in the Union. He would limit its size to thirty or forty acres, as affording one of the most valuable demonstrations of all in the simple showing that a small, well-tilled farm is better than a large one to which equal care cannot be given. He would place each farm under the care of "an intelligent farm-hand, hired at the current rate of wages;" five or more farms to be under the supervision of "a superintendent skilled in both the theory and practice of modern farming." He shows that only about 100,000 acres of land in all would be required, and that the experiment, as national appropriations go, would not be costly.: Its beneficial influence on the agriculture of the country would be easily demonstrable. The model farm would be to the farmer what the technical school is to the mechanic, the engineer and the manufacturer. The farmer will learn better methods by observation, when he will learn them in no other way. "I can do that!" will be his exclamation when he sees superior results gained by a new as compared with an old process; whereas, what his eyes have not seen he is inclined to doubt, think-up with" and found at least safe.

PROCESS FOR SURFACING ROADS.

Not long since there appeared in the Los Angeles Times, an article on oiled roads: A new process of surfacing, which is said by experts, to be almost equal to asphalt.

The method appears on its face to be practical. It has been tested, it is averred, and stands the test of time admirably. It is here given in the hope that it may be studied with care by trustees of municipalities, boards of supervisors and associations having in view the making of roads and boulevards. The method differs from ordinary street or road oiling in that it is a veritable construction of a street out of natural soil with the use of oil. The resultant product is in fact very like an asphalt—lies as smooth and will last nearly as long. While more expensive than careless "oil sprinkling"—which experience has determined is practically useless—it is nevertheless so inexpensive as to be practical for use in cities and upon the main country thoroughfares.

The system used is about as follows: The street, which is a sandy loam, with some admixture of blue and red clay and slate and gravel, is graded and plowed six inches deep and pulverized with harrows. It it is very dry, a small amount of water is sprinkled on and mixed in so as to make it workable. Oil is then applied at the rate of one gallon to the square yard, and the cultivators mix it in to the depth of four inches. A second gallon of oil to the square yard is then applied and cultivated down to five inches. The oil is then turned under with a turning plow, four inches deep.

The process next succeeding this in the common forms of road oiling is the rolling of the road, which crushes down a thin scum on the surface that later scales off and leaves the road full of chuck-holes. But with the new system the next process is one of tamping. A huge cylinder about eight feet long and five feet in diameter, weighing some 5000 pounds and furnished with rows of flat-headed teeth, is hauled back and forth over the street, slowly tamping the oiled earth up from the bottom to within two inches of the top. When the tamper first goes over the street, it sinks the teeth, which are about six inches long, clear to the end in the soft, oily earth, but each time a new layer of solid asphalt is plastered on the bottom, and the cylinder rises a little out of the mass until, when the tamping is finally completed, the mixture is so solid that the teeth no longer sink in .

There is a vast difference between merely crushing the surface of an oiled road with a roller and tamping five or six inches of oil and soil from the bottom up. That difference means years of wear.

At this stage of the proceedings the tamping is brought to within two inches of the top.. The street is then regraded, and the two inches of loose soil is cultivated and given one gallon more of oil to the square yard. That is altogether three gallons to the square yard, all applied warm, so as to sprinkle freely. Again the cultivator, and then the tamper, this time worked until it reaches the surface. When the tamper is done, the surface is a little uneven from the marks of the teeth, and this is taken out by a roller weighing two tons to twelve inches of tire. A more perfect surface can be obtained by a slight sprinkling of gravel before the roller comes on.

The cost of this work is about 16 cents a square yard, or $1 a running foot, to a 56-foot street (between curbs.) The cost on the ordinary city street where no grading was needed, would amount to from 30 to 40 cents a running foot of frontage. In other words, if done under the Vrooman act, a street could be practically paved for about $15 to $20 to the lot—provided that curb, sidewalk and gutter were already in place

The oil used is of 12.5 gravity, Baume, containing 69 per cent. of soft D-grade asphaltum, free from sediment and of gravel. The time required for the work is about twenty days to the mile.

"Help one another," the snowflakes said,
As they cuddled down in their fleecy bed;
"One of us here would not be felt,
One of us here would quickly melt;
But I'll help you and you'll help me,
And then what a big, white drift we'll see."

FREE SEED DISTRIBUTION.

The farmers are "getting on" to the fact that the free seed business of the congressman is a graft They the letting this thought be known too. By resolutions, in organizations, they are stating the fact before the country.

The fact has been long demonstrated that the distribution of seeds such as are sent out by congressmen accomplish no good in the world. The seeds are usually worthless, seldom of varieties wanted or needed by the farmer, and, beyond being appreciated as a remembrance, thought very little of by the farmers themselves. If the congressmen could only realize that the farmers of this country are not children, nor cranks, nor fools, they would wake up and cut out this unmitigated nuisance. It is very pleasant to contemplate the action of all the influential farmers' organizations condemning this foolish waste of money.

STATE MODEL FARMS.

The Department of Agriculture is making a strenuous effort to relegate the "free-seed" graft, and establish in lieu thereof a system of experiment farms throughout the country.

The plan is to have an experiment station in every congressional district presided over by an expert agriculturist, whose duty it shall be to provide information to farmers and furnish seeds when possible suitable to the locality where the station is located.

At present the free distribution of seeds costs the Government $150,000 a year. Messrs. Galloway and Spillman of the Agricultural Department purpose that this amount be used in equipping experimental farms. If Congress can be made to see, says the Journal of Agriculture, the good that would be accomplished by such a method of educating the farmers, it is safe to say that an additional appropriation for the purpose would soon be forthcoming. With the seedmen and many farmers fighting the "free-seed graft," there is no hope for any betterment of the present service, so if the "model farm" plan can be substituted for it, it is hard to see how anyone can be opposed to it.

Government officials estimate that with the $150,000 now spent in distributing seeds two experts can be sent into every State and Territory to establish experiment stations. It is expected that the farmers would gladly furnish the land and equipment for such farms, so that the only expense to the Government would be the salaries of the experts, which would not average more that $1.500 a year. Nearly every experiment station now being operated in the United States is self-supporting, and many of them are returning a profit. In the case of the new stations such profits could be used for extending the work.

The plan has its merits which appeal to the Cultivator as worthy of consideration. The "free-seed graft" is a back number. It has been a "cinch" for Congressmen, but it has done the country little good. It will probably require some education to get the idea out of the minds of members of Congress that they are not relinquishing some precious perquisite which will tend to strengthen them with their constituents, but the end of the "free-seed" monopoly is evidently near at hand.

RECOMMENDATION OF GRANGE.

The national Grange will make as specialties before Congress this winter the National Good Roads Bill, known as the Grange Currier Road Bill which makes a national appropriation of $24,000,000 to be alloted to the different states in building a national system of good roads; also the Parcel post. The Grange has advocated the parcel post many years, and has many times shown up the fallacy that it will increase rather than diminish the deficit in the post-office appropiations. The opposition to the parcels post comes from three of four big express companies, who have had their offices and "favorable men" in Congress and in the United States Senate, and who now have a monopoly of the business, whose stock is quoted at $200 or $300 above par, who pay twelve per cent. dividends, and get forty per cent. a year on the actual investment.—Farm Journal.

News of Country Life in the Golden West

Southern California

AGRICULTURE.

Early tomatoes are one of the best paying crops in Orange county.

Santa Ana has been favored this season with 12.58 inches of dampness.

Santa Maria has had 12.53 inches of rain to date. 18.74 inches of rain for Chino.

Redlands has received near 16 inches of rain to date, and nobody is asking for more at present.

Within a week it is expected that the first shipment of asparagus will be under way from Imperial.

One million orange and lemon trees for planting in Imperial Valley is what Dr. H. J. Fuller is planning.

In the Fullerton district the 1906 tomato crop was fully three times larger than that of the previous year.

Plans are being made for a big rabbit hunt and round-up on the 22nd of this month, on the Jurupa ranch near Corona.

Seeding of sugar beets at Chino for the coming season, is just starting and the prospects couldn't be better. There will be a large acreage and everything is favorable.

Since the duty was taken off American cattle by the Mexican Government carloads have been crossing the line to replenish the rundown ranches in various parts of Mexico.

Vegetable men are already planting the seeds of the summer varieties of tomatoes about Santa Ana with the expectation of picking the first of the crop sometime in June.

The first carload of cabbages from Southern California this season shipped from Olive by the California Vegetable Union. The first shipment will net the growers $20 a ton.

The Japanese of La Habra are making heavy shipments of peas to Los Angeles daily, hauling them to Whittier, where they are shipped over the Pacific Electric at a very low rate.

Never before was there so many cattle and hogs raised in the "desert" section, and the shipments of these is adding to the feeling of comfort and satisfaction prevailing among the farmers.

About forty acres of asparagus will be planted this spring near Imperial, by the Messrs. Stone and Pashgian. Under the warm desert sun, vegetables are usually precocious, and ripen at a time when prices are high.

A big crop of cabbage has been put in, in the vicinity of Olive this season, and a Los Angeles vegetable house is building a packing house there to handle the crop. It already has contracted for 250 acres and expects to get 200 more. Indications are for a big crop.

What the Hunington Beach cannery's output will be next season may be computed from the figures of last season. If the tomatoes handled from 50 acres, put up 200,000 cans and 2000 barrels, the yield from 500 acres will produce something like 2,000,000 cans and 20,000 barrels.

Last season the Huntington Beach Cannery, turned out 4000 cans per day during the height of the season in October and November, and altogether put up 200,000 quarts, or 8000 cases of 24 cans each, besides 2000 barrels of pulp to be used later in the various forms of catsup, pickling and sauces.

The barley crop is painting the Imperial Valley green where tens of thousands of acres have been given over to stubble for several months. Filling in the space between the alfalfa fields, the barley is making more apparent the period of prosperity which prevails generally over the country.

H. E. Hart and son of La Habra, netted over $1000 on a crop of tomatoes from eight acres. For several weeks they received as high as $70 a ton. It is reported that land in La Habra produces from eight to eleven tons of tomatoes per acre suitable for canning, and from three to four tons per acre suitable for eastern shipment.

HORTICULTURE.

Celery is fast being shipped by rail from Smeltzer and Newland stations. The shipments for the week foot up to 163 cars.

Between $22,000 and $23,000 have been distributed to the orange growers so far this season by the Santiago Orange Growers' Association.

The heavy rainfall of the past month, about four inches more than normal, has seriously retarded the work of the farmer and orchardist in Southern California.

Many orange trees are being planted in spite of the high price of $1.75 each which is demanded. Orange trees are scarce at this figure and lemon trees are not to be obtained at any price.

Payments just made by the Santiago Orange Growers' Association show a net profit of $1.32 per box on the tree for orchard runs, for the holiday shipments, with a possible 10 cents additional at the end of the season.

The increased flow of the artesian wells about San Jacinto is very noticeable. Many old wells that had not flowed for years are now delivering good streams and other wells have increased their flow two and three fold.

W. S. Corwin and son of Highland, have received the returns for a car of Lisbon seedless lemons shipped last month and sold in New York, January 30, by P. Ruhlman & Co. They received for the car $1151.35 gross, or an average of $3.21 per box.

The orange shipments from Redlands during the week just closing, amounted to seventy-eight cars. Most of these were sent out last Friday and Saturday. This brings the total to 839 cars for the season, which is over 300 cars short of last year's record to date.

The net profit on the tree per box for orchard runs for the December shipments in the Santiago Association is $1.11, also with the possible addition of 10 cents per box at the end of the season. The net profit for orchard runs for the holiday and December shipments last year were between 75 and 85 cents.

Northern California

AGRICULTURE.

Hog cholera is prevalent on some of the ranches in the vicinity of Petaluma.

Shortage of railroad cars is assigned as the cause for the shutting down of the sugar beet factory in Visalia.

The fifteenth annual citrus fair of the Cloverdale Citrus Fair Association will be open on Tuesday evening Febuaury 19.

Fire entirely destroyed the Bulter creamery at Point Reyes last Saturday causing a loss of $6,000, partially covered by insurance.

H. L. Wilson of Alpaugh, states that at the present time contracts have been signed for over 500 acres of sugar beets in his section.

It would seem that the beet industry in Tulare county was becoming the most profitable industry from the number of acres that are to be used in the culture of the sugar beet this season.

L. B. Spencer of Princeton, and several of his neighbors are going in heavily for hogs. Last season Mr. Spencer raised a large number of swine, which in exactly six months weighted an average of 160 pounds and brought over $9 a peice.

The Fresno Poultry, Pigeon and Pet Stock Association, announces their Show dates for December 11th to 14th (inclusive) 1907. This is the tenth annual exhibition given by the association, and they expect this to be their banner show. Judging will be by comparison.

The ranchers of the vicinity of Healdsburg, are taking a pronounced stand against allowing fishing, hunting or trespassing on their premises. In Alexandra Valley and other sections the farmers have united together for the enforcement of the law and propose carrying it out.

The State prison directors have fixed the price of San Quentin grain bags for the year at 7 3-4 cents, which is about 1 cent under the market for other grain bags. Those farmers who take time by the forelock and get their orders in now, will benefit thereby on the basis of current quotations.

HORTICULTURE.

Diunba has had 9.72 inches of rain at last report.

Salinas does not care for more rain at present, having had 16.41 to date.

The rainfal in Suisun Valley for the season ending January 29th, is 15.22 inches.

Yolo county expects a most unusually heavy fruit crop this coming summer.

Dixon is becoming famous on more than one thing, one of the principal things being the horses bred here.

A single individual is planning to set out 150 acres of eucalyptus trees next year on land about four miles distanct from Modesto.

As has been their custom for years the Board of Supervisors of Sonoma made an appropriation of $150 towards advertising the coming Cloverdale Citrus Fair.

California's hop and raisin crops have benn exhausted at the largest prices paid in many years, and it is estimated that the orange crop will amount to thirty thousand car loads.

The precipitation for the last storm at Sisson is 3.44 inches. The season's precipitation is 18.32, inches, against 10.94 at even date last year. It is the heaviest and most persistent rainfall on record.

During the week seven cars of citrus fruits were shipped to market from Lindsay, four by the Independent Packing Company, two by the California Citrus Union and one by John Demartini & Company.

According to the gauge .42 of an inch of rain fell in the city during the forty-eight hours ending at 7 o'clock this morning. The total rainfall for the season amounts to 26.89 inches.—Watsonville Pajaronian.

George Blackburn of Healdsburg, received a large shipment of cherry trees, to be set out on the Hopkins ranch. The trees are the Royal Ann, and nine acres will be planted just as soon as the weather permits.

A. Exstein of Stanislaus, has sold more than 75,000 eucalyptus trees to date this season. With the expection of one lot of 11,000 to J. N. Lester, of Elmwood, the trees sold have been taken by people about Modesto.

In his report to the supervisors, Horticultural Commissioner Shell of Fresno states that 68,000 deciduous trees have been inspected and sorted in the county during the month of January by the commissioners.

P. B. Norton, traveling passenger agent for the Union Pacific railroad, was in town Tuesday and states that he has purchased a tract of 160 acres of land near Remnoy, Tulare county, and will plant it to eucalyptus trees.

The rainfall since our last report has been 1.13 inches, making for the season 17.92 inches against 8.28 to a corresponding date last year. In February of last year the precipitation was 4.54 inches.—Sutter County Farmer.

We understand that the Burr Brothers still have several cars of Washington navel oranges on the trees in their Sunny Slope grove, near Lindsay, which are now in excellent condition and will be shipped to market at once.

Another vineyard association was formed this week at Williams, Colusa county, and 80 acres of fine land were bought by the association at $100 per acre. The purchase lies seven miles west of Williams and adjoins the Brim vineyard. It will be planted to Thompson seedless and seedless Sultanas.

F. R. M. Bloomer, a Sacramento horticultural inspector, visited the orchards in the Cosumnes river valley during the past week. He reports that the orchards in that part of the county, as a whole are in good condition, with the exception of a little pear blight which the owners are willing to eradicate.

Observations on Liming of Soils

Continued from page 155

noticeable than on dry soils. The sour humus and organic acids are not only unfavorable to the growth of nitrifying ferments and the root tubercles of leguminous plants but also are likely to dissolve iron and other compounds which are poisonous to microbes and crops.

Water-culture experiments have shown that slightly acid solutions are favorable to the growth of plants, and while most soils possess this character to a slight degree, yet any excess of soluble acid in the soil would be highly detrimental. While most of our cultivated crops seem to need a slight acidity, it is probable that they have the ability to create this condition to a sufficient degree through the medium of the solutions sent out by their roots. This being the case, it would seem that the aim should be to keep soils in a neutral or slightly alkaline conditon so as to favor the growth of root tubercles of the legumes and the desirable soil ferments.

Liming is excellent for correcting any excess of acidity, and is probably the most effective and economical substance for bringing about these other desirable conditions.

Physical Results.

The many chemical changes brought about by the action of lime on soils results in producing physical changes which gives soils new mechanical characteristics. Lime has the power of changing the physical properties of a clay soil and making it more friable and easily cultivated, and putting it in a condition so that water may pass more freely through it. This will make it less susceptible to extremes of dry or wet weather, and make it a good home for the roots of the plants. The action of lime on sandy soils may be said to be the reverse of that on clay soils; that is, it has a cementing action, making such soils stick together and in such a condition that they will hold more water and not dry out so rapidly.

The changes are brought about by what is termed the "flocculation" of the clay and organic particles. It has been found that one (1) part of lime has the power to flocculate and clear 10,000 parts of a turbid liquid, so that is can be readily understood that an application of one ton (35 bushels) of lime would have marked effect on an average soil to the depth of six inches which weighs approximately 900 tons.

Other Effects.

As has been stated, application of lime produces a beneficial effect in giving a favorable medium for the growth of nitrifying organisms and of the root tubercles on the leguminous plants (particularly the clover.) Lime is also sometimes applied to prevent the "Club-foot" of cabbage, celery and of certain root crops. It is sometimes used to destroy larvae, slugs and worms, but experiments do not bear this out and it is doubtful if it has such an effect. Applications of lime are also supposed to favor the development of certain injurious and undesirable conditions such as the scab disease in potatoes.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for greatest batch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be isued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. FILCHER, Commissioner.

And Now Comes New Reward for Merit

FEED HOPPERS.

"I WOULD like to try the dry feed method" writes a correspondent, "but I do not know how to make a hopper. Will you please write in the Cultivator just what a hopper is and how to make one."

What a Hopper is.

Webster defines a hopper as "a chute, box, or receptacle, usually funnel-shaped, with an opening at the lower part, for delivering or feeding any material, as to a machine; as the wooden box with its trough through which grain passes into a mill by jolting or shaking; or a funnel through which fuel passes into a furnace, or coal etc., into a car."

The Maine Hopper.

It can be easily seen how there can be a great variety of hoppers, large or small and of almost any shape that suits the fancy of the maker or owner. The Maine Experiment station has a hopper which is merely a long trough, any convenient length, say six or ten feet long, a board about ten inches wide forming the bottom, the sides five inches high to hold in the feed, and the ends sixteen inches high from floor to roof;

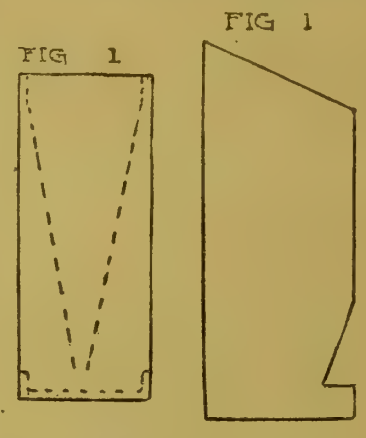

Fig. 1.—This hopper is my own make. The fowls can eat from both sides of it, as will be seen from the dotted lines. It is made from a cracker box and holds nearly two pails of ground feed.

laths are nailed inside the five inch sides two inches apart to enable the hens to put their heads in to eat the food, but preventing them from throwing the grain out. The roof is made separate from the trough; it is two boards nailed together at right angles to make a gable, these boards should be four inches longer than the trough so as to extend two inches beyond the ends, this roof is easily removed for filling the trough by lifting one end and sliding it endwise on the opposite gable end on which it rests.

The Maine Experiment Station has found this trough, or hopper, the best thus far used for saving food from waste and for keeping it in good condition. In separate compartments of a trough of this make the fowls are given cracked corn, wheat, oats, dry-meal mixture, dry cracked bone, oyster shell, and charcoal. Troughs made after this simple pattern are being used by W. C. Stephenson of Gardena in his yards thirty-eight in number, and wth most satisfactory results. I say this because Mr. Stephenson is one of the successful poultry men in our own locality. Coming here a novice in the business four years ago persevering through discouragements in the commercial side of eggs for market, he has made a success of it and now has some exceedingly fine fowls, grand layers and beautiful birds. He is quite enthusiastic over the dry feed method and the "Maine" hopper or feed trough.

Other Styles of Hopper.

In the Cultivator of August 30th last I gave a description of the home made hoppers, which I have been using for some time, these are so simple that any one can make them in twenty minutes. They are made from cheap box (I used a Bishop's chacker box) such as one can obtain at any grocery store and the exact dimensions are not important. I began by making the front edge only three inches deep; this I found was not deep enough, it should be five inches deep. The slanting board down which the feed slides into the trough should end off three inches from the bottom and it should be about the middle of the trough which is the bottom of the hopper.

Another hopper which is called the "Sanborn," because invented and used by Dr. Sanborn, is the result of his experiments with dry feeding covering several years. This hopper he says has more good points and fewer poor ones than the best of the others.

It is made in two parts: First, the box that contains the feed, and second the moving top(or folower) that drops as the food is eaten and also prevents scratching of the contents. The box can be of any size desired, according to the breed of fowl and the number of birds using each hopper. A hopper should not be made larger than is needed to hold a week's supply for the birds that are to feed from it. It should not be made so deep that the birds must get on to the wire covering in order to get the food, Dr. Sanborn says:

"Use to make the boxes, unless boxes are already made, thin boards, half inch lumber, though three quarter inch stuff will not be too heavy. Make the box to hold the dry food sixteen inches square inside and five inches high inside measurement.

The second part of this food hopper is the wire covered frame that rests on the food and drops with the eating of it. It is a "follower," following the food, as it diminishes, to the bottom of the box. Make this of inch square lumber, cutting the parts so that when put together there will be a quarter inch spare space on every side between the frame and the inside of the feed box. After nailing these pieces together as you would a frame for window netting, cover one side with a piece of two inch wire netting, cut just the size of frame. Fasten it to one side of the frame, using plenty of wire staples so as to avoid any sharp wire ends getting loose and injuring the heads of the hens.

How to Use a Hopper.

Fill this feed box nearly full of mixed food, having it higher at the sides than in the middle and drop the "follower" into place. Where to put the hopper is a matter for each one to decide. It can be put on top of a sill of the house so that the side of the feed box is twelve inches above the level of the scratching material. This prevents dirt and straw being scratched into the hopper. The hens step or jump to the edge of the feed box, eat all they desire, then visit the drinking dish, and pass back and forth until satisfied.

More Hoppers.

Another hopper made by a friend of mine is made out of oil cans, he says they are the best and cheapest dry food hoppers he ever saw.

Oil cans are about nine inches square and fourteen inches high. He takes one, lays it on its side, measures a line one inch and a half from the corner and cuts along it the whole length of the can; he then cuts up the inch and a half at each corner and cuts down two inches and a half at each corner, the lower cut (2 1-4 inches) he bends in so there is no sharp edge to hurt the hens and so that any food they may drop from their bills will slide down into the can again. The top edge he turns out to form a little roof. He fills this hopper with a small shovel. He finds that there is no waste of food and it takes but a few minutes to make one.

Another hopper is given in the North West Poultry Journal also made from an oil can. The directions are as follows: Set the can straight up on the work bench and measure seven inches up from the bottom and make a mark, then cut the can in two going all the way around with the tin shears as nearly seven inches from the bottom as possible; throw the upper part away and you have a can seven inches high and nine inches square, but if left as it is the upper edge is sharp and might cut the birds feet so just measure an inch down at each corner and cut with the shears, then turn the sides down one inch. You have now a receptacle six inches high, nine inches

square. Now take two sticks eleven inches long and about half an inch wide and lay them across each other at the center of each and tack them together with two small nails. Now fill the can about two-thirds full of feed and lay crossed sticks on top; make sure the sticks are loose enough from corner to corner in the can to slide down with the feed as it is eaten.

Best Position for Hopper.

Set the hopper on a bench or shelf in the poultry house in such a way that the fowls cannot scratch straw or dirt into it. (It might be hung on a nail making a nail hole at one side.) You will find that a hen cannot scratch the feed out on account of the crossed sticks, also that she will not stand in the hopper and ditry the whole thing, because it is only nine inches square and she does not care to pick under herself to get the feed; she will stand outside or on the edge and eat like a lady and if you have the water and

FIG 2

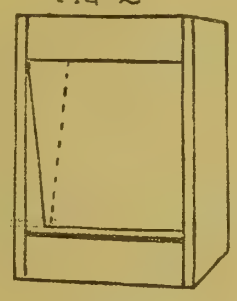

FIG-2

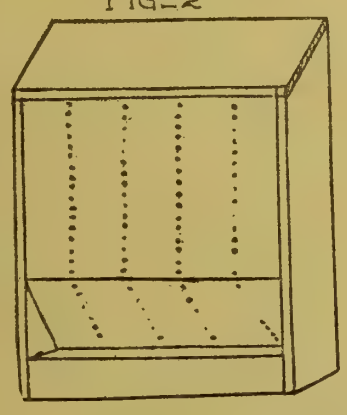

Fig. 2.—The above plan of Dr. Nottage's hopper is from Farm Poultry. The front view shows by the dots the inside divisions, five, in which he places the different foods. The hopper can be made with or without these, the size depending upon the size of the flock and the frequency of feeding. The trough into which the feed falls should be three inches deep and should have a beading on the edge an inch and a half wide to prevent the feed from being scattered out.

grit on the same bench she will move over to that and then down into the litter and then to the hopper again and then perhaps to the nest to lay and at night she is tired, but satisfied and has not over-eaten or loafed on the roost and caught cold and many other ills and diseases, but is vigorous and healthy and ready to commence the same routine tomorrow.

If any of our readers cannot make their own hoppers I would advise them to get some made very much like the pattern of the Maine hoppers. These can be bought at supply houses in Los Angeles, and doubtless in all parts of the state. When I was away, weather bound at Ventura, my home-made hoppers were used for kindling and I bought some cheaper than I could make them and find them more satisfactory than any I have used.

Next week I will talk about the food that it is best to put into these hoppers.

DEATH DEALING DEVICE.

Maurice Chaulin, a French inventor, has perfected a clever apparatus for killing mosquitoes. It consists of a small lamp—electric or oil— hung between two rings, the rings being connected with tiny vertical and parallel chains. These chains are charged with a current of electricity, sufficiently strong to kill instantly a mosquito which touches any two of them at the same time. The light in the lamp, which is entirely surrounded by these chains, attracts these insects to their death.

The Capitol Avenue Poultry Farm of San Jose has doubled its matings this season to keep pace with its rapidly increasing business. Its new catalogue will be of interest to all lovers of fine poultry.

An Open Secret

It is an open secret among poultry raisers who have been successful that food is not all that makes hens lay. Often times even the greatest care and attention to proper feeding will not produce eggs at this season of the year. Such a condition is invariably due to digestive difficulties and sometimes disease. Dr. Hess Poultry Pan-a-ce-a meets this condition. It is a tonic, increasing the powers of digestion, supplying iron for the blood, cleansing the liver, arousing the egg-producing organs, reddening the comb and brightening the feathers.

DR. HESS
Poultry PAN-A-CE-A

is the prescription of Dr. Hess (M. D., D. V. S.). In addition to increasing egg production it cures and prevents poultry diseases. Besides being a tonic it has a special property peculiar to itself—that of destroying infection, the source of so many poultry diseases. It bears the indorsement of leading poultry associations in the United States and Canada. Costs but a penny a day for about thirty fowls, and is **sold on a written guarantee**

POULTRY SHOWS AS EDUCATORS.

The show season just closed has been one of the most remarkable in many respects in the history of fancy poultry west of the Rockies. From Portland on the north to San Diego on the south come reports of successful shows. In almost every instance the entry was larger, the attendance better, the quality of stock higher than previous years.

Shows are not given, as a rule, to make money either for the Association or the exhibitor, but as an educator. First it is necessary to get the public sufficiently interested to induce them to attend, then it is for the exhibitor of the different breeds and varieties to explain the fancy and utility points of his particular breed; in this way the public is educated to see the advantages of standard-bred poultry.

We have in mind many instances where people attended poultry shows merely as onlookers, not being interested in thoroughbred poultry. Yet, after having the good qualities of the various breeds explained to them and seeing the additional price a prize-winner sold for, they decided that perhaps there was "something in it," and before they left the show had either bought stock or eggs.

Best Breed.

Many go to the show to find out the best breed. Hardly a day passes but we are asked which is the best breed of fowls. We always give the same answer: "There is no best breed." Select the one that seems to strike your fancy most favorably and breed to improve both for fancy and utility purposes.

We might start with Asiatics, the largest of all our domestic fowl, hardy and fair layers, good mothers and a splendid bird. Next in size are the Orpingtons and Dorkings, which are considered in England the best all-purpose fowl in existence. The Orpingtons are at present enjoying quite a good deal of praise in this country and are worthy of it, for they have much to recommend them to both fancier and rancher. They are hardy, mature rapidly, are good layers and a fine table fowl. Then comes the American class, comprising the Plymouth Rocks, Wyandottes, and Rhode Island Reds. These breeds are bred for both meat and eggs and the three varieties of Rocks, the eight varieties of Wyandottes and two Rhode Island Reds, give the fancier ample scope for color and shape. All are quite popular and each have their good points. The Barred Rocks are bred most extensively of any breed today and perhaps the hardest to breed up to a high type of exhibition fowl. If you are going in for egg trade alone, we would take the Mediterranean class, comprising the Minorcas, Leghorns and Andalusians. These are considered our bet egg-producers and lay a large white shelled egg, are non-sitters, and good foragers. If we were going in for strictly fancy, we would take up one of the many varieties of Bantams, as almost all large breeds have their counterpart in minature specimens, for which there always is a good demand at fair prices. Most all Bantams stand confinement well, are hardy and breed true to color and type.

So we might go on through the long list contained in the American Standard of Perfection, take up the good qualities of the different breeds and varieties until you would want to put in a pen of each. But our advice is alweys the same; that is, take one kind and stick to it.

A Big Business.

Many who do not stop to think, imagine that the "chicken business" is a small thing. Let us look at the lay of the hen in the United States for last year. We find she laid 1,293,814,763 dozens of eggs, her product amounting to $280,000,000. More than the aggregate value of gold, silver, wool, and sheep during the year. More than the crops of flax, timothy, clover, millet, beans, hay, and straw all told. About $100,000,000 more than the great American hog; and cotton, once king, now yields to the American hen, by over $20,000,000 in her favor.

This is based strictly on the market value, not counting the enormous outlay for eggs for hatching that are sold every season from $1.00 for a sitting to $1.00 each.—F. H. Thomas.

The Ornamental Garden

By ERNEST BRAUNTON

THE CHILDREN'S GARDEN.

ENCOURAGE the children to have a garden for their very own and do not in any wise interfere with it, except to advise and do not be to insistent even in this. Aim to awaken pride and self-reliance in both boys and girls.

The time they have mornings and evenings is more than sufficient for a school child—they will have as well, plenty of time to play or help mama. Do not encourage too large a space or when the hardest times come it may prove a discouragement and have a lasting and blighting influence upon the child's life. Better to do a little and do it well, than have the child learn how to half do it's work.

The child should be allowed to choose the kinds of plants; if all sunflowers are wanted and the child is persistent, let the sunflowers be planted. They may, before the summer is over, prove somewhat of a disappointment, but no schooling is so thorough or lasting in its effects, nor so beneficial all through life as that gained by experience. If the child wishes vegetables and flowers mixed it might be-token a well-balanced judgement—a natural shrewdness such as gave birth to the saying: "Never put all your eggs in one basket." If left largely to its own wishes and resources, the child will learn more in a summer than all the rest of the family combined could possibly teach it, and that learned would never depart.

SWEET PEAS.

The sweet pea is such an unconventional and domestic flower that it is unsuited to formal beds or to an obtrusive position on the lawn. It is one of those flowers which we enjoy the more if it is somewhat hidden from the public view, and is restricted to the more private and personal parts of the ground.

It is preeminently a flower for the backyard. A rear or side border, against a fence or other background, is a good position for it. The plant is always attractive when seen clambering over bushes, but it rarely thrives well when planted close under shrubbery unless it is grown in a box or large pot of rich earth plunged into the ground, to remove it from the competition of the roots.

If one is to raise a considerable quantity of sweet peas, they may be planted in rows and allowed to run up a screen of chicken-wire; or, if one can take the pains to tie them occaionally, a trellis m,ay be made of four or five strands of fence-wire, like a half-size grape trellis. On good soil most varieties will reach a height of five feet or more.

If sweet peas are to continue to bloom throughout the season the soil must be good and capable of holding moisture. A thin, dry soil will not grow good peas. In light soils it is well to apply a liberal dressing of manure to the soil in the fall, plowing it under very early in the spring; and in addition to this a dressing of some concentrated fertilizer in the spring may be useful. But the chief thing is moisture.

The land must be well and deeply tilled, to increase its water-holding capacity. It is ordinarily advised to till the soil frequently after the peas are planted until they begin to bloom, at which time all cultivation should cease. Usually, however, tillage should be continued. The land becomes hard by constant tramping of visitors when the plants are in bloom, and the evaporation from the soil is thereby greatly increased.

A heavy mulch of straw or litter may be placed on the soil when the plants begin to bloom, to conserve the moisture; but if the rows are far enough apart to allow of it, a frequent stirring of the soil all through the season with a horse or hand cultivator will be found to be the most efficient conservator of moisture. The plants also endure dry weather better when thinly planted. We like to have the plants six or seven inches apart in the row.

PLANTING SCHOOL YARDS.

Keep the center of the place free. Do not scatter the trees and shrubs over it. They will be in the way. The boys will break them down. Moreover, they do not look well when scattered over the whole area. When an artist makes a picture with many people in it, he does not place the persons one by one all over his canvas. He masses them. Thereby he secures a stronger effect. He focuses attention rather than distributes it. Most persons make a yard a nursery by planting trees all over it. The same trees and shrubs can be used to make either a nursery or a picture.

Begin with the fundamentals, not with the details. If an artist is to make a portrait, he first draws a few bold strokes, representing the general outline. He blocks out the picture. With the general plan well in mind, he gradually works in the incidentals and the details—the nose, eyes, beard. Most persons reverse this natural order when they plant their grounds. They first ask about the kinds of roses, the soil for carnations, how far apart hollyhocks shall be planted.

It is as if the artist first asked about the color of the eyes and the fashion of the necktie; or as if the architect first chose the color of paint and then planned his building. The result of this type of planting is that there is no plan, and the yard means nothing when it is done. Begin with the plan not with the plants. The school-ground should be hollow—well planted on the sides, open in the interior. The side next the highway should contain little or no planting. The place should be a picture, not a mere collection of trees and bushes.

ROSE CULTURE.

The rose is very modest in its demands upon cultivation and permits of more neglect than most other plants. Perfect flowers, however, are produced only under certain climatic and soil conditions, which can be easily supplied. Roses delight in a heavy but sandy loam, and respond readily to liberal cultivation and fertilization. Well-rotted cow manure and an occasional dose of bone meal is all they require in the form of fertilizer, and it is best applied as a top dressing in preference to spading it into the ground on growing roses, as the feeding fibrous roots in our shallow land are near the surface of the ground and easily cut by deep spading. Roses do not come to perfection in our city gardens, where drainage is often very poor and where the air circulation is imperfect, where the sun only reaches the plants during a short part of the day, and where insects and diseases have full sway. The latter are the unavoidable consequences of unfavorable conditions, and insects will attack a sickly plant much quicker than a healthy one.

THE PALMS.

It was Linnaeus, the great Swedish botanist, who always spoke of the palms as the "Kings and Princes of the Vegetable Kingdom," an appellation fully warranted by their erect carriage and noble appearance.. They certainly are the most ornamental of all plant life, and it is upon them chiefly that we depend for that distinctive tropical appearance of our gardens which is the admiration of all tourists from less favored climes.

The soil and climate of nearly the whole of California is peculiarly adapted to their successful culture, and after being once established, they require but little care to keep them in first-class condition.

There are spceies so hardy that they endure, without injury, the frosts and snows of the southern part of both England and Ireland.

Here, where they grow so luxuriantly, we should make them the most prominent feature of our landscapes, and no California garden, however small, is complete without one or more members of this strikingly handsome family; plants whose beauty constantly increases with age.

"Stunted lamp-light"—smoky chimney, poor draught, imperfect fit, cracking chimney, clouded glass—why do people put up with this when *good* lamp-light is the best light to read by?

I make and put my name—MACBETH—on lamp-chimneys that are clear as crystal, never break from heat, and fit perfectly.

MACBETH lamp-chimneys give lamps new life.

Let me send you my Index to tell you how to get the right chimney for your lamp; it's free.

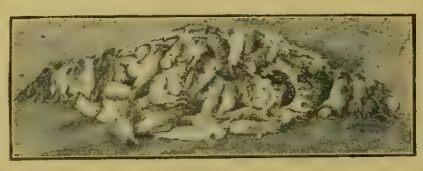
Now is the time to go for gophers with **Bille's Gopher Poison.** The gophers go for it and it will go for them good and plenty every time.



This is a photo of 201 killed in one day on a ten acre field before they could get back to their holes, with one bottle of

BILLE'S GOPHER POISON

Endorsed by Agricultural Colleges and Experiment Stations. Not one of the ordinary poisons, but in a class by itself. Has had greatest success in the Middle West. The secret being that it is most attractive to gophers, squirrels, etc., and sure death to them. It gives the grain a glossy coating, retaining the poison for weeks. Hundreds also die in their holes by eating it there. We have bought the patent rights for this section and are selling at the eastern price of $1.25 for large bottle. The ingredients cannot be bought at a drug store for that price. Money refunded if not as represented—so printed on the bottle. If your dealer does not keep it send $2.50 for two bottles, express prepaid by us. Anyway send for circular with affidavit of above killing, and a few out of many testimonials.

Compounded under Bille's patent by

Queries and Replies

Hemorrhage in Horse.

I have a mare about 10 years old that discharges blood from her mouth, since July she has had four severe attacks; she eats barley hay besides running in pasture; she seems lively enough only after one of these spells; she seems weak and has no appetite.

She has lost about 1-2 gallon of blood at each hemorrhage and coughs at the time.

Can you tell me what the trouble is? —D. N. T., Los Angeles.

Could not tell what causes the hemorrhages without making an examination. The case is peculiar.—(Dr., W. J. Oliver.

Windbreaks.

Can you tell me what is the best tree to plant for wind-break; for quickest growth? Am thinking of setting poplars; which is best, Carolina poplar or silver poplar? Some think cottonwood. My idea is a tree for a wind-break that will grow quick and not sap land too much as blue gums, if I can get one as good. Thanking you for your trouble.—D. F. C.,Modesto.

Carolina poplar is possibly the quickest growing tree of those you name, and will doubtless be the one for you to plant, as it has proven a success in your section. In choosing trees for this, as for any other purpose, the suitability as exemplified in local plantations, should be taken into consideration, as there is no teacher so good as experience.

Indian Runner.

Can anyone tell me where there is a market for Indian Runner duck eggs? They seem to go a begging here.—M. P. S., Corcoran.

I should think your best market would be at your nearest large town. Bakeries (especially the German bakeries) much prefer them to hens eggs as they are larger and richer. I add a teaspoonful of water to the white of each egg and then they beat up lighter than hens eggs. They are very delicate and delicious and have not the coarse flavor of other duck eggs.—Mrs. A. B.

Flower Garden Questions.

In answer to L. D. of Wilmington, would say that rusty iron in the ground by the roots of Hydrangeas, will often make the flowers bloom, but extensive experiments carried on in this country and Europe, have demonstrated that soils containing slate are a stronger contributing influence. Common roofing slate pounded up, and mixed with the soil, will certainly bring blue flowers.

The plant which you speak of as Solanum Erectum properly Cyphomandra betacea, may be procured from almost any nursery advertising in the Cultivator in passing along our street we have noticed quite a number the present season, but do not recall the exact location. The fruits are not at all poisonous, on the contrary, are most excellent as food.

Both Cape jessamine and clematis need shade in order to thrive in our climate. It takes apple trees but a few years to bear from seeds, but it is problematic whether the fruit will be of value. The chances are that it will be of very little value.

Tomato Worms.

Could you give me information in regard to tomato worms? They are a large green worm; I believe they call them tobacco worms. What is the best remedy; also what is the best kind of Eucalyptus tree to plant on the Colorado desert?—S. & M., Thermal.

The tomato worm is so large and conspicuous that knocking them off into a can and afterwards destroying them is more effective than any other method of control.

The question of what eucalypt is best to plant on the Colorado desert is a broad one. We believe the red more generally satisfactory than any other.

Artichoke.

Will you kindly inform me the best variety of artichokes for table use, also the most prolific, also any information you can give me in regard to same and greatly oblige.—A. D. M. Laton.

The best Artichoke for California, is known as the Large Green Paris, a vigorous grower, yielding large buds. "Wickson's Vegetables" says the Artichoke will thrive on any well prepared garden soil, even on heavy adobe, but likes to be well fertilized.

The plants grow readily from seeds, which generally are planted in September or May, but planted later, if irrigation water is not available, and also grows readily from dividing the crown or from suckers of the root crown.

They should be set in rows four or five feet apart, and the plants three feet apart in the row. The flower buds are ready to eat as soon as they are well formed, and before the scales begin to open. When the bud is picked, the shoot on which it grows should be cut clear down to the ground. This will insure more shoots, and consequently a larger crop.

Eucalypts for Shasta County.

Having noticed the article in the Dec. 27th issue of the Cultivator, and other articles on Eucalyptus, I should like to have the following questions answered in your paper as soon as possible:

1. Could some species of Eucalyptus be grown with profit in this section.

2. What species of commercial value would be best suited to this soil and climate?

3. What are the characteristics of the best one or more species; give in order according to the adaptability of each species to localities like that described below.

4. What culture would be necessary to make them grow well?

Elevation about nine hundred feet, (much land quite level.) Soil red, with a good deal of gravel. Depth of hardpan, about 4 to 6 feet. Wild timber, digger pine growing occesionally above one hundred feet. White, live, and black oak growing as high as seventy-five at times. Underbrush; manzannita and chapparral. Extremes of temperature; one hundred and twelve degrees and about twenty-five degrees above zero respectively. Some years snow, and others none.

It is necessary to irrigate in summer to raise good fruit here (peaches etc.) R. K. H., Olinda.

If the temperatures in your section are as stated in your letter, you certainly can grow at least three Eucalypts. E. tereticornis; E. rostrata, and E. rudis. All of these are grown to the north of Sacramento and San Francisco. These are doubtless named in the order of their desirability for your section. This answer seems to cover all questions you have asked, for no culture is needed but to keep down weeds, as with any crop, and if possible to water at times during first summer—once a month will not be too often, and if you wish to rush them one or two irrigations the second summer will help.

Cow Cough.

Will you kindly answer through the columns of your paper what is the matter with my cow?

She is a large cow in good flesh, has a splendid appetite, chews her cud all right and apparently is in good condition. She is dry now and has good care, but she has a cough that seems to trouble her. What might be the cause. —A subscriber, San José

I should ask my family physician to put his ear to her chest and see if the cough is a lung or merely a throat cough. If from the lungs I should have her tested with tuberculin at once. The apparent health of a cow is one of the deceptive features, I have seen apparently healthy cows when opened, have a generalized tuberculosis.—M. E. S.

Fruit Drying.

Will you kindly publish in the Cultivator how to dry fruit: peaches, plums and pears, in particular, and

how to pack them for the market.—L. S. H., Auburn.

I fancy this subscriber never has seen the working of a cutting plant or a packing-house running or she would not think in the space allowed for questions and answers that this could be treated in full.

If the editor of the Cultivator thinks (when the season for drying fruit comes around) it wise and desires me to do so, I will write up the subject in a general way. The absolute particulars are different in each locality and I know no royal road to this knowledge. Personally, if I wish to know anything I go and learn it from experts. I have crippled my right hand until my writing is not readable by doing pruning in the vineyard until I knew how it should be done. The same in packing grapes. I know no other way than to do it until you have mastered the underlying principles.—M. E. S.

Planting Eucalypt Seed.

Will you please tell me at what time and in what manner eucalypt seeds should be planted to give success?—T. G. E., Otay.

The best time to plant Eucalypts as trees, is about the first of March, and to get them ready for this time, the seeds should be planted about the first of September. The trees will then be six or eight inches high at planting time. We fear that success will not attend your efforts by handling them at the present time, and at the proper time we will give full directions for doing the work. For the present, it is sufficient to say, that it is not impossible to grow the trees from seeds at this time of the year. The seeds must be planted in a very light friable soil, containing a good proportion of sand. This should be firmed by placing a board on top of the soil and standing thereon, if the seeds are planted in open ground, or see that the soil is firmly packed down if planted in boxes.

None of these seeds should ever be more than raked in if planted in the open ground, and if planted in boxes, an eigth of an inch of the very lightest soil should be sprinkled over them. The seed bed should be kept shaded until the young trees are well up, after which they should be kept shaded only during the very hottest part of the day, and gradually inured to the sun by the time they are three inches high. The bed must never dry out at any time, and for this reason, may require sprinkling with a fine sprinkler two or three times a day, until the plants are well up.

Brome Grass.

How do you think Bromus inermis would do for pasture grass here?—H. D. W., Santee.

Just how much Brome grass has been used in California, we are unable to say. The most drought resisting grasses which have been tried thus far, are Australian rye grass, and orchard grass. Brome grass is a deeply rooted plant, more drought-resisting than either of the two mentioned, and constantly thrives where there is a decided lack of moisture. The grass forms a closely knit turf, and after a crop of hay is taken off, the aftermath furnishes excellent pasturage. It yields both hay and pasturage in surprising amount, and we believe you would find it advantageous to grow in your section.

In other sections of the arid west, outside of California, it is highly esteemed.

Alfalfa Meal.

Will you kindly answer through the Cultivator if alfalfa meal will take the place of green feed for chickens. —Dedini, Petaluma.

Nothing dried will "take the place" of succulent green feed for either chickens or cows, but alfalfa meal, or good alfalfa hay, makes a fair substitute. I am using the alfalfa meal mixed with the other feed, and find it excellent. In feeding hens (as well as cows), it is well to remember they require a certain amount of "roufage" and the hay or alfalfa meal makes excellent roufage. If the fowls do not at first like it give them only a very little, increasing by one spoonful only each day, till you are giving about twenty per cent. alfalfa meal or hay. —Mrs. A. B.

Spray Grape Vines.

I would like the opinion of the best authority on your staff in regard to the spraying of grape vines with Bordeaux mixture during the dormant period. I know of no one in this vicinity who has ever tried it and have never seen anything written on the subject. I have considerable black knot on my muscats and contemplate spraying in February with Bordeaux, made by the 10: 10: 50 formula, which is the strength I used for my peaches. I would like to know what effect this would have on the black knot, if it would not invigorate all the vines if it is the proper strength to use and if February is a good time to apply it

Any information in regard to this matter will be appreciated.—C. F. C., Dinuba.

Bordeaux mixture will do your vines good, but it will not overcome the black knot. Your formula is all right, even after the vines are in leaf. Straight bluestone water 1 pound to 10 gallons is a good spray material to use before the buds begin to open.—J. W. M.

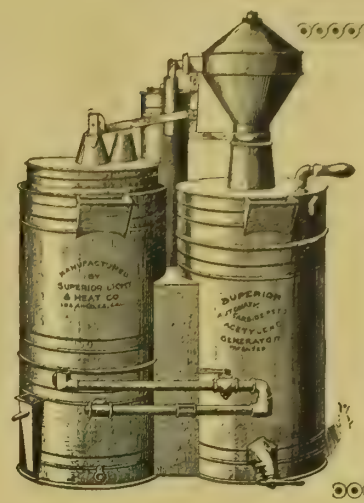
Plowing Under Weeds.

Are common weeds of any value to plow under as clover crops.—W. H., Dinuba.

Most certainly, especially valuable if containing any legumes, such as burr clover or lupins. Any vegetable matter will add to humus of the soil, but a regularly sown cover crop is by far the best.

Piles Cured In 6 To 14 Days.

PAZO OINTMENT is guaranteed to cure any case of Itching, Blind, Bleeding or Protruding Piles in 6 to 14 days or money refunded. 50 cents.



"I must have gas in my home," says the farmer. "Then buy the Superior Generator," says the man who has used one. "Would not be without mine," say all users. The general satisfaction which the

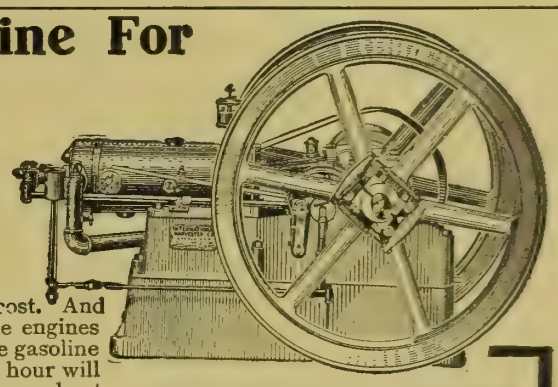
Get an Easily-Operated Engine For

IRRIGATION PUMPING



WHEN you buy an engine for irrigation pumping you don't want to get one that will require an engineer to run. What you want is an engine that will practically run itself for hours at a time. One that is sure and safe and steady, one that is simple in construction, and easily understood and operated.

I. H. C. Gasoline Engines

are that kind, and for that reason are especially adapted to pumping for irrigation. A small boy can look after an I. H. C. Engine, and run it as successfully and economically as anyone. Look it over once or twice is all that's necessary in a day's run.

Now, what else do you want in an engine for irrigation pumping?

Economy—To be sure, you want an engine that will pump the largest amount of water at a small cost. And here again I. H. C. gasoline engines fill the bill. Ordinary stove gasoline is the fuel, and the cost per hour will be about 1½c per horse power—about 45c a day for a three-horse power engine working 10 hours. That's cheap enough isn't it? And convenient. You can buy gasoline by the barrel, and always have plenty of fuel on hand.

Durability—Because I. H. C. engines are simple and strong in construction, they are durable, too. There's nothing much about them that can wear out. Repairs are small and inexpensive; parts can always be readily obtained, and you can replace them yourself.

Ease of Operation, Economy, Durability—these are three good points that help give I. H. C. gasoline engines a superiority over others.

If you are now using any other power, or if you are planning to pump for irrigation this year, go to our local agent and examine these famous engines. They are made in various styles (Vertical and Horizontal, Stationary and Portable) and in sizes ranging from 2 to 20-horse power. During the seasons when not in use for pumping they can be made to serve in a hundred other ways.

Call on our Local Agent or write nearest general agency for illustrated catalogue.

Household Department

RUDOLPH THE HEADSMAN.

Rudolph, professor of the headsman's trade,
Alike was famous for his arm and blade.
One day a prisoner Justice had to kill
Knelt at the block to test the artist's skill.
Bare armed, swart visaged, gaunt and shaggy browed,
Rudolph the headsman rose above the crowd;
His falchion lightened with a sudden gleam,
As the pike's armor flashes in the stream.
He sheathed his blade; he turned as if to go;
The victim knelt, still waiting for the blow.
"Why strikest not? Perform thy murderous act!"
The prisoner said. (His voice was slightly cracked.)
"Friend, I have struck," the artist straight replied.
"Wait but one moment and yourself decide."
He had his snuffbox—"Now, then, if you please!"
The prisoner sniffed, and, with a crashing sneeze,
Off his head tumbled, bowled along the floor,
Bounced down the steps—The prisoner said no more!

—Oliver Wendell Holmes.

A WAR STORY.

A WOMAN never forgets a lover; a man may forget the woman he has loved.

During the civil war Lieutenant Lawrence Nolan, aid-de-camp to a general of brigade, encamped in Virginia on the grounds of a manor house belonging to a family named Lavalette. The owner of the plantation and his sons were with the Confederate army, but his wife and daughter, Rosalind, were at home. The women, though their hearts were with the southern cause and especially with the father and his sons at the front, had the good sense to treat the Union officers who came to the house courteously. By this means they insured protection for themselves and their property. The command to which Nolan was attached remained in camp on the Lavalette plantation for several months, and, among other officers, he was a frequent visitor at the manor house. Love, which knows no barrier, ignored the fact that Rosalind Lavalette was a rebel and Lawrence Nolan an invader of the homes of herself and the southern people.

It was in the sweet summer time, and life had in it for the young people far more of zest than either had known before. The ring of the bugle and the beat of the drum were heard in the land, uniformed men were coming and going, the air was laden with strains from military bands, while occasionally there came from a distance the booming of cannon. Amid all this the young officer, snatching occasional moments, when off duty, pleaded his cause. Nothing but principle stood in the way of a favorable reply. The girl could not bear to give herself to an enemy of her country.

When the brigade moved, Nolan had only time to ride to the manor house and bid adieu to the girl he loved. Cutting a button from his sleeve, he gave it to her as a souvenir and told her to keep it till he should call for it. "When peace comes," he said, "I will come to ask again for the word I would be so glad to hear now. Till then goodby."

He asked for a parting kiss, but she refused him. "How could I look my dear father in the face," she said, "when he returns if I had been kissed by a Yankee?" Nolan sighed and mounting, rode away.

When the Union army left the Lavalette plantation the place at once sank into its accustomed quiescence. There was nothing but the waving trees, the hum of insects, the songs of birds. Not again did any part of either the Union or Confederate armies visit it. Rosalind Lavalette spent her time comforting her mother for a son and brother who had been killed in a skirmish with the brigade that had been encamped on the plantation. Lawrence Nolan gave the order in the name of his general to send the body to the mother and sister, and, though he believed that his heart would remain forever where he had bestowed it, he gave up all hope that Rosalind would ever be his wife.

When peace came several years later the episode on the Lavalette plantation had become a pleasant dream to Nolan. He was even then but twenty-two, and his impressions were the evanescent impressions of youth. He had had several other later affairs during the war, and these had tended to wear upon the effect of the first. He left the army and began the study of a profession. Occassionally he would be seized with a desire to go south and seek Miss Lavalette, but be feared that if she would not listen to his suit before his corps had killed her brother she would not listen to him after that distressing event. He had not the nerve to ask the hand of one whose hospitality had been thus repaid. He must study his profession for several years and even after acquiring it must wait patiently for an income. And so the matter of his first love gradually slipped away from him.

Forty years passed. Nolan, who had become prominent in his profession was elected to congress. One evening soon after his arrival at the capital he was introduced to a white haired woman of refined appearance and with a southern accent.

"We have met before," she said.

"When? Where?"

"During the civil war, in the south."

Nolan looked at her inquiringly. "That was a long while ago," he said.

"Indeed it was, but I have remembered you, long though it is."

"You can't be the girl who nursed me when I was wounded?"

"No. You were perfectly well when I knew you."

"Nor the girl I met at Richmond at the close of the war—the one over whose home I stood guard one night?"

"Nor than one either. You gave me a keepsake at parting. I have it yet."

"Oh; I know you. I remember well that evening in your garden at Charleston when I gave you a rose and you said you would keep it as long as you lived."

The lady smiled. It was a very sad smile.

"Guess again."

"I give it up," said Nolan, seeing that he was continually geeting deeper into the mire. The lady moved some lace about her neck and showed an army button that formed the head of a stickpin.

"Do you remember giving me that button?"

Two men approached.

"Miss Lavalette," said a voice, "permit me to introduce my friend, Colonel R."

"Lavalette?" mused Nolan, moving on, with a troubled brow. "Who the deuce was Miss Lavalette."—F. A. Mitchell.

HELPFUL HINTS.

Hang Nails.

If the ends of the finger, as far up as the first joint, are rubbed with oil it will prevent hang nails.

Care of the Eyes.

If one must read while lying on the back, the book or paper should be adjusted so that it will be at the same angle with the eye, as it would if one were sitting in an erect position.

To Help Bunions.

Bunions are usually caused by pressure or friction. Relieve the pressure on the joint by placing a disk, made for this purpose over the bunion. If the foot is plunged into hot salt water it will relieve the soreness.

Filing the Nails.

The finger nails should not be filed too closely at the sides, as it tends to destroy the skin which holds them in place and allows them to spread, spoiling their shapeliness as well as making the finger ends blunt and club shape.

Florida has passed a law prohibiting diving for sponges, as the beds are injured thereby.

AT A BROTHER'S GRAVE.

A remarkable oration, and one that has occasioned some discussion as to Col. R. G. Ingersoll's actual convictions regarding a future life, was his address at the funeral of his brother. Many hold that in it he admits the doctrine of immortality. His adherents have ever claimed that the expressions were only those of a breaking heart reaching out for the hope of a future life.

"My Friends—I am going to do that which the dead often promised he would do for me. The loved and loving brother, husband, father, friend, died where manhood's morning almost touches noon, and while the shadows still were falling toward the west. He had not passed on life's highway the stone that marks the highest point, but, being weary for a moment, he laid down by the wayside, and, using his burden for a pillow, fell into that dreamless sleep that kisses down his eyelids still. While yet in love with life and raptured with the world, he passed to silence and pathetic dust. Yet, after all, it may be best, just in the happiest, sunniest hour of all the voyage, while eager winds are kissing every sail, to dash against the unseen rock, and in an instant hear the billows roar a sunken ship. For, whether in mid-sea or among the breakers of the farther shore, a wreck must mark at last the end of each and all. And every life no matter if its every hour is rich with love and every moment jeweled with a joy, will at its close, become a tragedy, as sad and deep and dark as can be woven of the warp and woof of mystery and death. This brave and tender man, in every storm of life, was oak and rock, but in the sunshine he was vine and flower. He was the friend of all heroic souls. He climbed the heights and left all superstitions far below, while on his forehead fell the golden dawning of a grander day. He loved the beautiful, and was with color, form and music touched to tears. He sided with a weak, and with a willing hand gave alms; with loyal heart and with the purest hand he faithfully discharged all public trusts. He was a worshiper of liberty and a friend of the oppressed. A thousand times I have heard him quote the words: 'For justice all place a temple and all season summer.' He believed that happiness was the only good, reason the only torch, justice the only worshipper, humanity the only religion and love the priest.

He added to the sum of human joy and were every one for whom he did some loving service to bring a blossom to his grave he would sleep tonight beneath a wilderness of flowers. Life is a narrow vale between the cold and barren peaks of wo eternities. We strive in vain to look beyond the heights. We cry aloud, and the only answer is the echo of our wailing cry. From the voiceless lips of the unreplying dead there comes no word; but in the night of death hope sees a star and listening love can hear the rustle of a wing. He who sleeps here when dying, mistaking the approach of death for the return of health, whispered with his latest breath: 'I am better now.' Let us believe, in spite of doubts and dogmas and tears and fears, that these dear words are true of all the countless dead. And now, to you who have been chosen from among the many men be loved to do the last sad office for the dead, we give his sacred dust. Speech cannot contain our love. There was—there is—no gentler, stronger, manlier man."

ON THE SLEEPING CAR.

"Some day whin I am down town I am goin' to dhrop in on me frind th' prisidint iv th' Pullman Company an' ask him to publish a few hints to th' wayfarer. I wud like to know how a gintleman can take off his clothes while settin' on thim. It wud help a good deal to know what to do with th' clothes whin ye have squirmed out iv thim. Ar-re they to be rolled up in a ball an' placed undher th' head or dhropped into th' aisle? Again, in th' mornin' how to get into th' clothes without throwin' th' thrain off th' thrack? I will tell ye confidintially, Hinnissy, that not bein' a contortionist th' on'y thing I took off was me hat."—"Mr. Dooley."

POSSIBILITIES OF POTATOES.

There is no vegetable so universally used on American tables as the potato. From January to December a day rarely passes without its appearance at some meal, but many housekeepers are apt to confine themselves to two or three ways of serving—baking, boiling, frying and mashing. The following recipes will add variety to the list.

Boiled Potatoes.

Cut cold boiled potatoes into slices a quarter of an inch thick, and lay them on a gridiron over a hot, bright fire. Brown them on both sides, sprinkle with butter and salt, lay a bit of butter on each, and eat very hot.

Stewed Potatoes.

Pare, cut in dice, and soak in cold water half an hour. Boil in salted water—enough to cover them. When tender, but not coming to pieces, drain off all the water, and pour over them cream, which has been slightly thickened with corn starch. Season with pepper, salt, and chopped parsley. Boil up once, and turn into a covered dish.

Moulded Potatoes.

Mash or beat up the potato lightly, working in milk and butter, but don't make it too soft. Pack the mixture closely into small cups, which have been wet with cold water, turn out on a greased platter, and brown in a hot oven, glazing with butter as they color. Serve on a flat platter.

Potatoes Souffle.

Bake a dozen large potatoes and, when done, cut a round piece of skin from the side, and scrape out the potato. Add one cup of cream, the yolks of three eggs, a large spoonful of butter, a little pepper, and salt. Beat the whole together, then put in a saucepan, and heat thoroughly. When hot, fill the skins, cover the opening with the whites of the egg, beaten stiff, put them into the oven, and brown the egg slightly.

Potato Pie.

Boil some potatoes, mash until they are smooth, season with salt and pepper, heap on a pie dish, put a bit of butter on the top, and brown in the oven.

Creamed Potatoes.

Put into a saucepan three tablespoonfuls of butter, a small bunch of parsley, chopped fine, salt and pepper to taste, stir until very hot, then add a small tea cup of cream or rich milk, thicken with two teaspoonfuls of flour, stir until it boils, add chopped cold-boiled potatoes, and boil up once before serving. This is an excellent way to use, at lunch or breakfast, potatoes left from the dinner of the previous day.

Potato Croquettes.

Boil half a dozen potatoes, mash and cool thoroughly, sift twice through a colander, then beat well with a fork or eggbeater, and roll lightly into balls. Then roll in beaten egg and powdered crackers, and drop in boiling lard. Turn once only, and do it with a wooden spoon to avoid breaking; if you have not that most useful article, a wire fry-basket.

Celery Walnut Salad.

Pare, core and cut into dice six large tart apples, add two pints of chopped celery and one cupful of minced English walnut kernels. Dust over a teaspoonful of salt, one of paprika and two tablespoonfuls of tarragon vinegar. Mix all together then stir in sufficient stiff mayonnaise dressing to mix well. Serve in cups made by hollowing out pretty red apples.

Horseshoe and Cresent Cookies.

One cupful of butter, one of brown sugar, one of N. O. molasses, one teaspoonful of soda and one tablespoonful of cinnamon. Use just enough flour to handle nicely, roll out, cut into horseshoes and crescents, sprinkle with granulated sugar and bake quickly.

"As I was a-sayin', lady, I got a wife an' five children to support"—

"But how can you support them if you don't go to work?"

"As I was a-sayin', lady, I got a wife an' five children to support me."

The Produce Markets

Los Angeles Markets

LOS ANGELES, Feb. 13, 1907.

Butter

The butter market is much easier at the lower prices. The fresh product is moving out rapidly. However, not as much butter is being consumed as is possible at this time of the year and dealers are expecting another decline, which is bound to hasten the movement.

Highland	2.25
Sweets, Yellow, per sack	3.75@4.00

Vegetables

As was expected on account of the opening of the Chinese New Year there were no Chinese in the market, and as a result vegetables were scarce and higher. Few Chinamen will be in the market tomorrow, and those who do come in from the country will have only a very small supply because of their failure to pick today. As a result dealers owning stalls in the city market were stripped of green supplies and are expecting less tomorrow.

Citrus Market

New York Market.

NEW YORK, Feb. 12.—The weather has been a series of ups and downs of the thermometer during the week and is now in very unsatisfactory condition. Still, there have been good sales of oranges and California navels have advanced during the week. If even the disagreeable succession of warm and cold waves, accompanied alternately by snow and rain, which blockade streets and make even railroad travel difficult, cannot stop the advance of oranges, there is every reason to believe that with improvement in the brand of weather there will be a market which will give full satisfaction to the seller and joy to the grower.

The pushcart men and the street stands are now displaying oranges in considerable quantity. The present warm weather permits this. If it was snapping cold there would be less money going back to California.

All through the week there has been a good demand for California oranges. The demand for fruit is so active that it is hard to realize that it is winter. It seems more like spring, or even early summer. Some of this activity is due, perhaps, to the fact that other varieties of fruit are in relatively small supply. Another important factor in the situation is that other oranges, at least those which have arrived of late, have not fulfilled the expectations of buyers and they are turning to California fruit for their supplies.

Recent arrivals from Florida have shown the effect of the cold weather which, a few weeks ago, wrought injury. Nevertheless Florida stock has sold well. A car of Deerfield Grove fruit sold at $3.55 to $5.75 per box. But as a whole, prices for Floridas have ranged lower that those for Californias.

Porto Ricos are doing well, the market for them being better than it was last year, but it is none the less a fact that the Porto Ricos will follow the wild orange of Jamaica into oblivion as soon as the cultivated fruit is ready for shipment.

All citrus fruits are selling well from store. There has been, and is yet, a fair demand for substantially all varieties. The market for jobbing lots is steady. Retailers want considerable quantities of oranges and grape fruit and there is good profit in them. The present stagnation in the lemon trade is only a temporary matter.

Today being a holiday no sales will be made, either in this or other eastern markets. Yesterday's sales were as follows, the market was steady, the weather clear and cold. Thirty-four carloads of oranges sold:

Coulson's Growing Chick Food

Is a mash feed for the growing chicks, designed for feeding when you leave off feeding Coulson's Special Dry Chick Food, composed of articles, each the best in its class, combined in the correct proportion to form

A PERFECT BALANCED RATION

It contains blood meal, meat meal, bone meal, and other articles rich in protein, and the other elements, and is the feed you need to make your chicks excel in size and weight and enable them to become strong, vigorous and heavy-laying fowls.

COULSON'S GROWING CHICK FOOD WINS OUT

San Marcos, Cal, July, 23, 1906.
Gentlemen:

I tried COULSON'S GROWING CHICK FOOD exclusively my first year in business on Brown Leghorns. I sold the cockerels as broilers at nine weeks, averaging 2 pounds, 3 oz. each.

I tried my own mixture of feed the next year and took the same care of the chicks, and sold 75 cockerels as broilers, weighing 105 pounds, making an average of about 1 1-4 pounds each.

Having tested at my own expense the two methods I have concluded that COULSON'S FOOD is superior.

(Signed) J. B. HOOVER.

Coulson's Special Dry Chick Food

Is acknowledged by all The Best and most Reliable Feed for Baby Chicks.

COSTS LESS THAN 2 CTS. FOR FIRST FOUR WEEKS

ONLY HIGHEST QUALITY GRAINS, ETC,, USED

Special Dry Chick Food contains numerous different seeds adapted to needs of the little chicks, besides meal, charcoal, bone and many other necessary articles, each in Granulated form making

A PERFECT BALANCED RATION

CANNOT PRAISE IT ENOUGH

"I cannot say enough in writing in praise of your Special Chick Food. It is just fine. I never saw chicks do so well before."

J. S. SCOTT, Madison.

PULLETS LAY EARLY

"I have fed your Special Chick Food and Growing Chick Food to all my stock with one exception. I tried one lot of 350, and fed them my way of raising chicks back East. Results just fair. The other were fed up to three months on your Special Chick Feed, and the results were a surprise to me. The birds were large and the cockerels out of one lot I sold to the California Market and got a big price, with the request to send on to them at any time I had more cockerels of the same quality."

Respectfully, A. P. WARD,
Calistoga.

USE COULSON'S AND BE SATISFIED

SPECIAL OFFER.

Where Coulson's Special Dry Chick Food cannot be obtained from local dealers, we will ship, freight prepaid to any railroad station in California, 100-lb. sack for $4.00, or 200 lbs. for $7.50, cash with the order.

Good Roads Legislation for California

Practical Suggestions Regarding a Question of Growing Interest and Importance to Our State

By JAMES W. ABBOTT

IT IS a very remarkable fact in industrial development that neither nations nor states will adopt the policy of constructing first-class roads until forced to it by military or economic necessity. The Romans had to build them in order that their victorious legions might pass with celerity and ease between the imperial city and the confines of their increasing dominion. As their military power waned their roads were neglected and all passed more or less rapidly into decay. After the Romans there was no attempt whatever in Europe to build good roads until about the middle of the eighteenth century, and then only fitfully until the sublime genius of Napoleon planned that system of military roads which was the real renaissance of road building. Napoleon saw not only that he must have roads for his soldiers, but that if the peasants of France were to exist and pay their taxes from the meagre returns of an impoverished soil they must have easy access to markets.

This compelling necessity to build roads, because without them existence even was impossible, which was first clearly recognized in France, was principally responsible for the magnificent standard of roads which is the crowning glory of European civilization.

Eastern Road Building.

The superior attraction and profits of agriculture in the West caused the farms of the Eastern and Middle states to decrease in value and many of them to be abandoned altogether. That condition and that alone induced the farmers of New Jersey and Massachusetts to consent to a plan of taxation to begin the grand system of good roads, which has not only brought back into cultivation and restored values to the abandoned farms, but in many places has brought a prosperity to agricultural regions incredible to people familiar only with the rich soils of the West. The controlling reason why roads are so execrable in the rich valleys of the Mississippi and other rivers today, is because in spite of the waste the soil yields so abundantly.

The same conditions have applied all over the Pacific Coast. Nature has been most prodigal and riches have multiplied to an extraordinary degree, notwithstanding so large a percentage in places had to be sacrificed because of the bad road tax.

But the progress of road improvement teaches no lesson more forcibly than that when communities once actually experience the manifold benefits of good roads they will have them. You might as well try to arrest a stampeded herd of Texas steers with a gentle admonition as to stop people from getting good roads when they once find out by experience and observation how they pay.

A Coast Awakening.

There is an awakening on this Coast. Singular as it may seem it began in old Oregon; Washington caught the fever and now California has got it. It is in the air and in the blood. The people are going to have roads. The stampede has started. He is a wise politician who hears the gathering rumble and recognizes its significance.

Wherever in the United States that need has become urgently recognized the people have gone to the legislature for such laws as would enable them to get what they were bound to have. For the past fifteen years this movement has been on in the states east of the Mississippi river and a great deal of thought, study and experience have gone into the laws. Perhaps the most important principle which has been thoroughly demonstrated is that co-operation is necessary if people are to get roads. So far the National Government, which ought to contribute its just proportion has not been brought in. That will come later. In all the laws framed to date the state, county district and private interests have divided the burden; not in uniform proportion, or even in method at all similiar. Sometimes one or more of

James W. Abbott

Late Special Agent for the Rocky Mountain and Pacific Coast Division Office of Public Road Inquiries (now abolished), U. S. Department of Agriculture.

these interests did not contribute. Often another interest was brought in. The activities of convicts have been utilized to the very greatest advantage. A vast amount of study has been given to the methods of securing the money required from the various interests without present embarrassment, or future hazard. An equal amount has also been given to the best methods of securing the highest efficiency and rigid honesty. With but one or two exceptions the charge of the work to which the state contributed was vested in a department which gave sole attention to roads. The practice of having a state engineer who shall have under him a subordinate highway department has met with little favor and in my judgement is absolutely pernicious. The best results have been obtained by getting good officials for the highway department and retaining the same ones in office, just as a railway company gets a good engineer and retains him.

California in the Rear.

California today is suffering greatly because so far behind the procession in its general road practices. The tourists who were confidently expected to flood the state this winter haven't come in any overwhelming numbers. If this coast had such a system of roads as the state of Massachusetts is building, it would be generally recognized as the most attractive part of the whole world. It has'nt them, and other parts of the world which have, are for that reason getting vast sums of money which this coast loses.

The legislature now in session will be swamped with bills of every kind to afford relief. In determining what should pass and what should not, I would suggest that the first one which should pass should be to establish a highway commission with the same dignity and duties as the highway commission of Connecticut, for instance. The bill should not be framed on new lines, but on such as have been found practical and satisfactory elsewhere.

The bills of next importance should be those providing for raising money by direct taxation. Every man who owns any property should pay something for roads, and this tax should be not only a just, but a liberal one. It is the worst kind of saving at the spigot to waste at the bunghole to scrimp in this direction.

Third on the list in importance will be the bills which provide for incurring indebtedness to build roads. Here the utmost caution should be exercised. Many wild and visionary schemes for saddling obligations upon posterity are being urged, which if carried out will cause regrets hereafter resembling those which follow injudicious marital ventures.

Legislation.

Whatever legislation is enacted this winter, none of it will be perfect. A proper system of road laws for a state is a matter of evolution. I would suggest for consideration that one of the very most important things to do is to arrange so that this state can have the full benefit of the experience of other states along these lines. How would some such plan as this work? Establish a commission of five persons to compile, brief and digest the laws of each New England state, New York, New Jersey, Pennsylvania, Michigan, New Mexico and Province of Ontario, Canada. With the digest append a discussion of the subject and recommendations for the consideration of the next legislature. Let the commission be constituted as follows: The Highway Commissioner of the State (the state has a good one now. I hope it will give him a decent law to work under and retain his valuable services,) a lawyer to be appointed by the Governor of the state, and three commissioners to be appointed by the Governor upon the recommendation of the road supervisors of the state. One of these should come from the Northern part, one from the Central and one from the Southern and each should be a practical road builder. The Governor could invite recommendations from all the road supervisors of the state. From these recommendations it should not be difficult for him to determine the fittest road builder from each section.

The report should be made and published not less than six months before the assembling of the next legislature, and sent to every daily and weekly newspaper in the state. Such a plan would get before the people in digested form the good roads wisdom and experience of other states, and out of it should come legislation suitable to the needs of California.

Walnut Trees Come and let us show you the finest trees on the market.

Seedlings—A fine lot of large, thrifty trees at reduced prices.
Grafted Trees—1100 Placentia Perfection, personally selected and absolutely guaranteed.
Established 1887. **The Whittier Nurseries, Whittier, Cal.** Home Phone 288

When the others are planting orange trees by the million, why not you plant

WALNUT TREES

I have some very nice ones in all grades left.
Postal gets prices. **A. A. Mills, Anaheim, Cal.**

Use Tom Lewis' Fertilizer **Free From Weeds**
for Orchard, Garden and Field My stock is now ready. Immediate shipment guaranteed. Single sacks or carload lots. My testimonials are the finest. Send for circular and prices.
Office and Works: 1916-1918 10th St., Sacramento, Cal.

Grafted Walnut Trees
Placentia Perfection
1000 First-Class Trees, 10 to 13 Feet High

These trees were raised for our own use and are the surplus over our requirements. Growers who have both grafted trees of this variety and common seedlings, say they would pay $5.00 per tree for Placentia Perfection Grafts, rather than plant seedlings. They bear earlier, the nuts are less subject to blight, and sell at a big premium, being unquestionably the most ***perfect nuts on earth.*** Address

Deciduous Fruit Culture

By J. W. MILLS

DECIDUOUS FRUIT PESTS.

DURING past years, the idea was quite prevalent among the deciduous fruit growers of the north, that by keeping the orchards in a thrifty condition, by proper cultivation and pruning, there would be little or no trouble with insects or fungous diseases. The folly of such an idea is plain to most growers, though there are still some who hold to the old idea, and refuse to take precautions that protect and aid even their near neighbors. As an illustration of the folly of such an idea, we may take the black scale, and the orange trees that are in prime conditon at the beginning of the season, will be scaly six months later, and if no insecticide is applied, the tree will be black with scale and smut before another season is passed. Treat these trees for scale with an efficient remedy, but otherwise do not change the methods of culture, and the trees will be clean and healthy again. There is no need of a better illustration .

To bring the case down to the deciduous fruit trees, we may take an example from a Bartlett pear orchard, which we one time had charge of. We thought that the orchard was entirely free from San Jose scale, but were surprised to find that the largest tree, one which was planted in an old oak stump hole, and towered several feet above the balance of the rest of the trees, was literally covered over with scale. There were no infested trees closer than two miles away. The scale had evidently been caried there on the feet of some bird. The height of the tree making a reasonable resting place for a passing bird, and the fact that the scale started in the top of the tree, would indicate that the scale was introduced that way. The fact that the tree was the finest in the orchard would be in such a case the reason why it was infested with scale. The fact that it was the finest tree did not frighten the scale away.

Fungous diseases are just as sure to attack healthy plants, with the exception of those which enter only through some abrasion of the bark. Those that attack the leaves and fruit are natural organisms that must exist on certain kinds of plant food, and this food, no matter if it grows on a healthy or diseased plant, when the proper conditions appear, the host plant must suffer.

ALMONDS.

Almonds are perhaps the most uncertain crop that the California grower has anything to do with, even in those districts to which it is best adapted. A sudden cold wave that will not effect the most tender new growth and blossoms on a lemon tree, will sometimes cause an entire crop of almonds to drop, even when the nuts have grown to be an inch or more in length. As long as the kernel is in the liquid state, it is very delicate, and a frost that is hardly perceptible will make them drop. This dropping can be foretold to a certainty before it occurs, by opening a few nuts. If on the edge of the kernel, at any point, there is a brown spot, and the kernel has not solidified, the nut is sure to drop. If a large per centage shows this feature, it will indicate the extent of the drop.

Almonds are divided into three classes: hard shells, soft shells, and paper shells. There are numerous varieites of each, and while the hard shells are not popular, they are rarely, if ever, excelled in flavor. The Jordan almond is the highest priced nut on the market, in the shelled (kernels only) state, and it is a hard shell. The ordinary hardshell grown in California is not excelled in flavor by any of the soft or paper shells. It will keep for years, and not beocme rancid, while paper-shells will be unfit to eat when held over into the second year The hard thick shell of the former excludes the air, and acts as a seal. The soft shells which have entirely closed shells, keep proportionately longer than do the paper shells, which are usually open along one edge. This permits the air to carry the germ of rancidity, and as a consequence, the nuts must be used within a few months after ripening.

At four years the almonds will produce a fair crop and at eight years should be in full bearing.

Records at the old experiment station at Pomona show that at the age of eight years, the products of the leading varieties were as follows:

Hard shells, 63 pounds per tree. Languedoc, 48 pounds; Maria Dupray, 35 pounds; Golden State, 32 pounds; and Silver Shell 25 pounds. The last four named are soft-shells, and sell for more per pound than the hard-shells on that account. The hard-shell is 78 per cent. shell, Languedoc, 48 per cent.; Maria Duprey, 45 per cent.; Golden State, 30 per cent. This is not a desirable nut, as it runs 60 per cent. double kernels. While it would be popular at philopena parties, it is hard to handle as a confectionier's nut. Nonpareil is the best California almond for market purposes where it bears well. It is a late bloomer, and is liable to get caught with frost when many other varieties such as Languedoc, Silver Shell, Hard Shell, and Lewellings Prolific will escape.

STOCK FERTILIZERS.

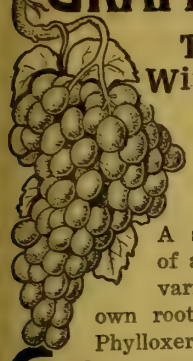
One advantage with dairy farming is the opportunity afforded for building up the fertility. Feeding the farm products to dairy cows enables the farmer to secure a large quantity of manure, while in dairy farming the purchase of more or less mill feeds, like bran, middlings, linseed and cottonseed meal, can be afforded and these add materially not only to the quantity but to the quality of the manure heap. There are few lines of farming where so little of the fertility is taken away and where so good an opportunity of putting it back.

SIMPLE SHUTTER SIGNALS.

A substitute for wireless telegraph, limited, however, in its application, has ben invented by an officer of the artillery branch of the United States army. Simple signals can be given by means of an enormous shutter, with slats a foot wide. These slats are painted various colors and are operated by a lever. The present high cost of the wireless system may give the shutter an important place in the signal service.

To Cure a Cold in One Day.
Take LAXATIVE BROMO Quinine Tablets. Druggists refund money if it fails to cure. E. W. GROVE'S signature is on each box. 25 cents.

GRAPE VINES



Table, Wine and Raisin Sorts

A superior selection of all of the leading varieties. On their own roots and grafted on Phylloxera resistant roots. Place your orders now.

Calimyrna Figs

Our Great Specialty

The genuine Smyrna fig of commerce. A very profitable tree to plant. None genuine without our seal attached to each bundle.

TREES

True to Name

ROEDING TRUE TREES FRESNO, CAL.

Grown under the most favorable conditions for the development of strong healthy trees. The largest and finest stock on the Coast.

Deciduous Fruit Trees

Citrus Trees

Ornamental Trees

All of the standard sorts and every one true to name. With our separate nurseries in different parts of the country, each having its special soil and climate best suited to the different trees, we are thus able to grow the finest stock.

Four New and Valuable

Burbank Creations

Our illustrated pamphlet tells all about them.

Santa Rosa Plum
Rutland Plumcot
Paradox and Royal Walnuts

We are the sole propagators and disseminators of the Burbank creations and we will gladly give any information regarding these great specials.

Nut trees, Shrubs, Roses, Palms, Greenhouse plants, Berry plants, Burbank's Crimson Winter Rhubarb, etc.

Our New Catalogue

Our new catalogue is remarkable for its completeness. It contains much valuable information, and is superbly illustrated. Mailed free to any address. Price list on application.

THE CALIFORNIA WALNUT.

The growing of walnuts is fast becoming a great and prosperous industry in this state, and John T. Harrington, a Colusa county grower, has the following to say urging the planting of walnut trees:

"Again and again we say, plant walnuts. We entreat our own people, and especially our young men to take advantage of the opportunity and not let the priceless plum pass from them. Of all the paying products it is the best. Think of it, young men. How can you invest a thousand dollars in a safer way and which promises surer and greater results? That sum of money will buy you ten acres of choice river land with a surplus sufficient to enable you to prepare and plant the ground and care for the trees for three years. In the first year the trees will grow from the nut to a height from six to eight feet, if properly cultivated. We mean, of course, for you to plant the common California Black walnut, and upon that stock bud or graft the English walnut, and in five years you will begin to reap your reward. The writer has at his home one tree (the older of the lot) which in five years from the graft produced last year nearly a barley sack full of walnuts. And they were all good, merchantable nuts, about sixty pounds, and worth in the market more than ten cents a pound. With one tree yielding that amount, what would ten acres do with fifty-four trees to the acre? Remember that was in five years. What would it be in ten or fifteen years, for they grow in capacity and increase in productiveness right along. There is a tree in Santa Clara valley, which it is said produced last year six hundred pounds. Of course, it is an old tree, but one of the same age in our rich river land—land of alluvial deposits, mixed with decayed vegetable mold, would be a thrifty tree, and produce even a greater quantity.

"The day will come as sure as night follows the day, when our river lands on either side of the great river will be a succession of walnut and orange groves. They are the most valuable products and the easiest handled. The labor problem can never disturb their successful harvest. The winds will help shatter off, and the children can pick up walnuts, while the winds and rains together do not hurt the oranges. Weeks and months may be employed in picking and packing them.

"It may be that the splendid opportunity which is offered our own people to profit by engaging in these excellent methods of making money will be passed by them and it will be given to others— strangers now to us —to reap the great reward."

BLIGHT CANKER.

Every once in awhile we receive from some reader a commumication giving his opinion of the cause of blight in apple and pear trees. Usually the correspondent suggests some mechanical reason for the blight. Now it is no longer necessary for us to guess concerning the cause of this disease. It is perfectly well known. There are different kinds of fungi, causing different kinds of blight. These different fungi families are well known and have been named. One that has proved very destructive is Bacillus amylovorus.

In the main these blight-producing plants are favored by the rapid growth of trees whether the trees be pear or apple. The rapidity of growth helps the minute plant to get a foothold and develop. The plant that produces blight is very small and is a parasite. It lives from the sap in the plant it makes its home. A seed of this minute plant is called a spore. It gets into the tender parts of a leaf or a twig and sends its developing trunk all through the tissue near which it has fallen. When a thousand of these plants exist side by side they use up all the material in the cells. We will suppose a clump of these parasites have developed on a leaf. They quickly exhaust all the sap in their immediate vicinity and leave nothing but bry dead fiber. One such spot would not injure the tree, but when all the leaves of the tree are covered by such spots the leaves are killed and the life blood of the tree ceases to circulate.—Farmers' Review.

IT'S UP TO THE GROWER.

A fruit grower writes the Express: "A big crop is almost certain this year —bigger than for several years. Everybody knows there is not anywhere near help enough in sight to harvest it, and the Japs are getting so independent that they hardly want to work for a white man. What are we going to do about it?" Well, Mr. Fruit grower, it is up to you to make permanent arrangements for help, just the same as you plant permanent trees. You know the help you must have every year, and you know it is scarcer this year than for many years past and not likely to be more plentiful until the grower gets it.—Winters Express.

DECLINE OF THE FOREST.

To gain a clear idea of the change in the condition of the forest that has occurred in the course of settlement it will be helpful to compare its present state with the virgin forest. Picture a forest of unbroken continuity cloaking from summit to plain the mountains on both sides of the great interior valleys from the Oregon border southward to the Tehachapis where the two branches united to extend a long, hook-shaped arm over the uplifted areas surrounding San Bernardino valley and the adjacent plain!

The quality of the forest varied greatly in different localities, because numerous species were confined to certain regions by the natural factors, soil, climate, and elevation. The redwood forest occupied an area along the northwest coast over which ocean fogs drifted in summer; spruce and fir grew in the higher elevations; next below came the cedar with sugar and yellow pine; while nearer the valley, as a fringe to the heavy forest, was a belt of shrubs, or chaparral, intermixed with oak and drought-resisting pines. This magnificient resource, approximately 34,000,000 acres, or one third of the State, was unequaled by that of any other State in either the size and perfection of individual trees or its location on lands unfit for other uses.

The area of forest land in the State today is practically identical with the original area, very little having been turned to other uses. The changes, therefore, have resulted solely in a reduction of the area of merchantable timber. Two causes have operated to effect this change, lumbering and fire. —G. B. Lull.

"Did I understand you to say," asked Miss Woodby, "that you don't go in for society—at all?"

"Quite so," replied Crabbe. "Society is simply a silly school in which every nobody is taught to try to be somebody."

With the Citrus Growers

By J. W. MILLS

CITRUS ROOTS.

OUR ATTENTION has been called to the fact that the orange trees budded on Pomelo roots are apt to gum the first season. If this is a fact, it should be known and published, for when a young tree gums, it is sure to injure it, and in many cases it kills the tree.

It has occured to us that much good could be accomplished in the matter by informing some one person in regard to the facts. We have made arrangements with Prof. R. E. Smith at the Pathological Station at Whittier, to follow up the matter. A card addressed to him, stating that your trees (whatever stock they are on) are "gumming," or did "gum" at some time, if such is the case, will put your orchard in the line of investigation. It will not only help you, but aid prospective planters. If all those who expect to plant will make inquiries, and send this information to Prof. Smith, they will in a short time receive valuable information in return.

PRUNING THE LEMON.

The old style of lemon growing required that the trees should have tops of large proportions if large crops were to be expected. This required that the tops should reach high into the air. Trees allowed to grow in this manner made a rampant growth and the bearing period was delayed until the trees reached well on to maturity. It is a well established fact that fruit trees of all varieties, as a rule, do not bear large crops until they have passed their period of growth. When this tendency of the tree is satisfied either by natural development or artificial means its natural bent is to produce fruit. Pruning that will discourage a heavy wood growth will have the effect of throwing the tree into fruiting. There are several methods adopted to bring this about. The Baronio system is the most radical and several systems have been envolved from this. The open-center method, open horizontal trimming and semi-Baronio system are modifications.

The method used by the growers before the Baronio system was taken up consisted in suppressing the vigorous growth that carries the top of a lemon tree into the air. The work consisted of cutting back the rank growth, not by cutting the branches square off at any point where it was desired to end such growth, but cutting back to the main branch from which such growth started. This left no stub from which suckers are sure to start. The idea was to throw the greatest strength into the mature wood which had arrived at the bearing stage. This required regular pruning which at the same time kept the tree open enough to admit fruit wood and blossom. Enormous crops of lemons have been produced after this manner of pruning, and some of the most successful growers still prune after this method with perfect satisfaction. With this manner of pruning, the trees gradually increase in size and assume a globular shape. The long, straggling side branches are cut out as fast as they appear, as they do not mature the fruit properly, and the fruit on such branches is invariably scarred up by the wind. By cutting out such growth clear down to the crotch the branches are made so stocky that the wind does not whip them around nor do they need propping even when laden with their heaviest crops of fruit.

The open-center method consists of cutting out the center of the tree so that it assumes something of the shape of an inverted shallow cone. This is done by cutting invariably to a main branch, that is, the limb that is removed is cut clear back to the branch below it. This gives the inverted cone shape, and soon after the pruning is completed numerous sprouts will start up from these exposed branches and if allowed to will soon fill up the space with a perfect broom-like top. After these sprouts have grown enough to show which are suckers and which are fruit spurs, cut out all the suckers. The fruit spurs will be sufficient to shade the top (now nearly horizontal) branches. They will soon burst into bloom and bear fruit. Suckers will continue to grow and constant pruning will be necessary to keep them out. These suckers should be cut close to the branch from which they start. If a stub is left it will send out a cluster of new suckers. New fruit spurs will be thrown out from time to time, and it will necessary to allow all growth to mature enough to show if it is sucker or fruit wood.

These rules are applicable to trees that have arrived at the bearing age and have large tops. The modification of it for young trees is to encourage the growth of the horizontal branches and discourage the upright growth. This is not an easy thing to do and if the trees are not allowed to grow in the usual way till they are three or four years old they will require that a certain amount of branches be tied in place. It must be borne in mind that the branches which are to form the fruit-bearing surface must be cut back to a certain extent to make them stocky. It is easier to convert a half grown tree into an open-center form than to train one from the bud up. We have spoken incorrectly of the nearly horizontal position of branches in the open-center pruned tree. The main branches on such trees assume an angle anywhere between a horizontal to an angle of fifty or sixty degrees. The horizontal trimming is simply a near approach of the open-center to a horizontal position of the bearing or main branches. This style of pruning usually accompanies a tree with a single zone of branches. It is in reality and to all practical purposes the Baronio system.

Mr. A. R. Baronio, an Italian horticulturist of note, introduced into California lemon culture a method of pruning that is named after him. It is evolved from the physological principles which are stated by Mr. Baronio as follows:

1. A tree is most profitable when the sap is most evenly distributed over all its surface, each branch properly covered with elaborated growth all along from its base extending outward in methodical form; and when it is held under absolute control so that the root shall always be capable of feeding the whole top, which is kept within easy reach of the ground.

2. The sap circulates faster through a shoot running straight up in the air than through a branch going out in a lateral direction.

3. There is little or no elaboration along the length of a straight shoot until the top is reached.

4. There is a larger amount of elaboration along a branch in proportion as it goes out of a lateral direction.

5. There can be no fruitfulness without elaboration, therefore,

6. A lateral branch is more fruitful than an upright one.

7. If a young, vigorous shoot (commonly called a sucker) running up is allowed to persist on a branch, it will draw most of the sap and tend to starve the growth below.

8. A branch may be built slightly crooked and strong in short sections made up of wood of different ages and so pruned that a rush of sap never being permitted it is forced to elaborate a lot of small fruiting growth all along its length.

9. Fruitfulness and excellence are the results of a slow but steady circulation.

10. An over-accelerated circulation tends to foster unnecessary vigorous or rank wood formation.

11. A tree must never be permitted at the top to outgrow its root system, but allowed only sufficient wood formation to keep it growing and all the fruit compatible with its age and strength.

12. Branches should never be so crowded as to preclude the free admission of light and air between them.

13. In order that a tree might have the sap evenly distributed, its main branches must be of equal size and run out at similar angles.

14. A limb which branches off at an acute angle is liable to split at the fork.

15. A limb which branches off at a blunt angle is not liable to split.

16. A limb (like a chain) is not stronger than at its weakest point, and therefore there must be no weak points about it.

17. The strongest points of a limb must commence at its base.

18. Limbs seldom break down by mere weight, but mostly by vibration, which brings all the strain on the weakest point at the fork.

19. Main branches should be perfectly stiff, not affected by any vibration whatever.

It is from the above accepted rules that Mr. Baronio worked out his plan of pruning the lemon. The open- center horizontal system and the semi-Baronio system are all taken from the Baronio idea.

The last-named system is the most severe, as it reduces the tree to a one-decked structure, that is, there is but one layer of branches which makes as nearly as possible a horizontal disc shaped tree. The tree is started with three branches starting from different heights from the ground and held in a horizontal position by being tied down to stones with strong twine till they have become fixed in that position. Following up this plan, sets of two branches are selected from each of these three main branches. These six new branches are tied down to the original three so that they assume a nearly horizontal position. Superfluous suckgrowth is constantly removed so as to force the sap into the frame work of the tree. The operation of bending down upward growing shoots and building the frame work of the tree is continued as the tree expands in size.

One object to be kept in mind is not to crowd the branches so that it will be inconvenient for a man to work between them. As soon as these horizontal branches become established they will begin to throw out fruit spurs and will continue to bear lemons in proportion to the degree in which the sucker growth is suppressed.

When it is desirable to convert a bearing tree that has been pruned in the usual way or not pruned at all into the Baronio style of tree it is done by cutting out all the center, leaving only the lower branches. Should these be too high, say three or four feet, the tree is cut off just above the lowest branches and the suckers that come out from below are used for the new top and those branches are removed.

Some growers modify the Baronio system when converting old trees by simply cutting the top off square at a height of about eight feet and keeping the suckers cut out.

PLANT FOOD.

As for the supply of available plant-food in a soil, this can be determined by a chemical analysis of the soil, though its results may very often be misleading as no method has yet been found which exactly reproduces in the laboratory the action of the natural agents upon the soil. Too much therefore must not be expected of a soil analysis. There is, however, another, by far more reliable way to ascertain the shortcomings of a particular soil—that is by consulting the plant itself. The plant will invariably answer all reasonable questions propounded to it in the way of fertilizing experiments and every agriculturist can readily find out what his soil lacks by making practical experiments as above described.

It is obvious that only such fertilizers must be applied to a certain plant, as are of the most benefit to it and which supply such plantfood in a readily available form, which the particular plant principally requires, and which from the conditon and composition of the soil are the most wanting. The demands made upon the soil by the various crops differ so enormously that it is necessary to use special fertilizers for almost every kind of crop.

The principal plantfoods generally constituting a fertilizer are: Phosphoracid, potash, nitrogen and lime, which are mostly required in larger quantities by the plant that the soil is actually able to supply. All other elements used in the construction of plant life are generally found in all soils in such abundance that they will last for an indefinite time and need no replenishing.

Heavy rains have prevented plowing around Red Bluff, and the acreage of wheat will suffer.

Many large tracts of land have been surveyed into small tracts in recent weeks about Clovis.

Orchardists and vineyardists at Orosi are taking advantage of every clear day to put out trees and vines.

Santa Ana reports that there is a great demand for Valencia orange trees, as well as for other varieties of trees, and that the market for nursery stock is more active now than it has been in many years.

The Flagler Company packed a car of oranges belonging to Ben White of Corona. This was sold at auction yesterday and nets the grower, free from all expenses $1.12 1-2c all grades and sizes and Mr. White has received his money, which makes only fifteen days from the time the fruit was picked until the grower had the money in his pocket.

Gold Medal
Citrus Trees
Are fully described in our treatise of Citrus Culture, which is a trifle the best thing of its kind ever published. Contains about 50,000 words and 100 illustrations telling about oranges and lemons from the seed bed to the bearing orchard. Price 25 cents. Remember we are the largest producers of Citrus Trees in the world and stand ready to serve you with the finest nursery stock that can be grown. Correspondence invited.

The orange situation in the Redlands section of the orange belt is becoming critical on account of the car shortage. The famine has existed for a week past. One house which asked for fourteen cars, received two. No cars have been brought into Redlands this week by the Southern Pacific Company, although the usual supply at this season is from 30 to 40 cars per day. The packing-houses are crowded with fruit.

A Noted Herd of Jersey Cattle

A great opportunity is now offered to secure one of the finest herds of Jersey Cattle, one which California has not seen in many a day. It is the famous

Gen. W. R. Shafter Herd

Which was gathered together without regard to expense, the only demand being **quality.** "Is she a doer as well as a good looker?"

In this herd, some bred originally by Shields, Pierce and other best breeders and later some by Gen. Shafter himself, are many prize winners. A detailed record of each animal will be sent on application.

The whole herd will be sold in a body if satisfactory bid is received by Aprll 1st. After that individual animals will be sold.

W. H. McKittrick, Executor W. R. Shafter Estate
Bakersfield, California

FREE **A Booklet That Will Help You Get More Money**

Mr. L. A. Aspinwall, authority on potato culture has written a book for potato growers. We want to send you a copy free, also our illustrated catalog containing valuable spraying information and describing the

ASPINWALL POTATO MACHINERY most perfect machines for the potato growers' needs—Cutters, Planters, Sprayers, Diggers and Sorters, including the Famous Planter No. 3, with sack hopper, plants 99 per cent good without bridging in hopper. The triumph of the long years we have devoted to building potato machinery.

Write today; be sure to ask for booklet, **Potato Culture.** We will send it free and catalog of our entire line.

Live Stock and Dairy

By Mrs. Minna E. Sherman, Fresno, Cal.

MORE ABOUT HORSES.

THE points of a draft animal are entirely different from a driving horse. We must carefully select a sire that will transmit good muscles, kind disposition, have sound feet and be easily kept in good flesh. Select the breed of draft stock that produce the most saleable form of colts—the colts that every buyer is interested in at once. The average farmer has the misfit horse breed from mares that the traders have not thought worth sending to the cities. The farmer's mare usually is a long coupled, ordinary, weak backed, nondescript animal. She should be bred to the shortest, stockiest drafter of medium size that is at hand. I have found that the Shires and Suffock Punch stallions of medium size are fine for the first cross on these mares, as they nick kindly in almost every case.

Points of Desirable Horses.

I would choose a sire of about 1600 pounds weight—rather a heavier one—one as low and blocky as possible. These nick well on the long flat-sided, half American mares weighing 800 to a 1000 pounds. The colts produced are of express size with an occasional cart horse among them.

The buyers call a horse an "express" when he is about 1400 pounds in weight, has fair action and can trot along with a load. Their use is found, as the name indicates, in the one-horse express and delivery wagons. They need to have agility with a fair degree of good looks.

The cart horse is heavier, chunkier, and is used on wagons that deliver between the wholesale and retail dealers in the cities. He is often called "a big little horse," he is a low-bodied, short-legged, with a deep chest and a powerful puller. Speed is not expected, nor are good looks paid for in excess of his working value.

The best mare or fillies obtained from this cross should be retained on the farm for breeding stock. By the best mares are meant those best in comformation, not those that are heaviest in weight. The broad deep chest, round ribs and short barrel, or closely coupled body with flat bones in the legs. The legs should be well under the horses body, not like the little girls description of a cow, "An animal with a leg at each corner and a tail in the middle of one side."

The angle with which a horses feet strike the ground has much to do with the ease with which he moves a load. The foot is his grip on the ground; he seizes the ground, pushes and moves himself forward, dragging the weight until his other foot takes hold and moves himself forward yet another step.

A crooked hind leg does not give the same power as a straight one. The wear is not as even on hoofs and the horse has not the same chance of endurance. The pastern joint should be of sufficient length, particularly in the hind feet, to prevent pounding. I am sorry to say this is the common fault with draft breeds. A spade-shaped hind foot is common in heavy stock. I rarely see a draft stallion that would not be improved with a little more length in this joint. The agility and quick motion of the thoroughbred comes largely from the length. It has been suggested that the constant drawing of heavy loads has tended to shorten up this joint in the draft breed.

If the shoulders are not flat but ridged a collar will not lie smoothly on them; either a high or too low a wither is equally objectionable. The high withers tend to grow sore under heavy pulling, while the low withers do not hold the collar steady. At a sudden lurch of a load in a chuck hole the collar rises and catches the horse by the throat, he chokes and the wheel drops back into the hole. This has made more balky horses than almost any one other thing.

I saw a horse in a transfer wagon fall choked by a rising collar the other morning in front of the Southern Hotel at Bakersfield. I did not see that the driver recognised why, for he did not buckle tighter the strap running from the bottom of the collar to the belly band. A mule has to be put into a good harness that frames him all over, or else he will not work well, he will not tolerate the dangling straps, but must have things snug. The ranch work horse wears any harness, it matters little if it fits only so it hangs together long enough to complete the plowing.

The Next Cross.

The next sire used on the selected farm mares from the first cross can be a heavy draft stallion and a reasonable amount of first class heavy draft horses will be the product. The reason for not beginning with the draft stallion of heavy weight at first is that a large per centage of culls result, colts that are weedy, having big heads and feet, long slat like bodies, with little heart girth and weak as workers. They are too homely for city work in delivery wagons, too light for heavy work anywhere.

The temptation to breed defectively formed mares that are not saleable is often too much for the farmer. If he must breed these weedy ones, then breed them to the small chunky stallion. One questions why two crosses of the heaviest blood will not produce as good colts as a first cross with the smaller draft stallion and then a second cross with a heavy stallion.

The trouble lies here—the long backed mare is bred to a long-backed stallion, as the big stallion has necessarily a longer back. The back in the colts remains long and defective, while if it is shortened up in the colts after the first cross to the proper proportion; then when the larger horse is used the long back falls in proper relation to the rest of the frame and the length is properly proportioned.

In the second generation, the farmer must decide what he means to breed; Percherons, Clydes, French or German drafters, or perhaps Belgians. All are good as breeds, but he must chose one and stay by it, until he has perfected a type that will bred uniformly. When his geldings come so that they match reasonably well, then he will have colts that will have a commercial standing. The buyers soon know where the good horses can be found, and it will not be necessary to have the annoyance of horse traders coming to his door.

We say our horses are such a price and the buyers look at them; if they

rish thm, they purchase; if they hink they can do better elsewhere, hey go there, and so the matter ends rithout annoyance or any of the disgreeable horse bartering.

The Larger breeds.

Now in the larger breeds of draft orses the points of excellence differ. n breeding to a Shire or Belgian—he top line will be perfect; round ibs also will follow the blood. In the 'ercheron the legs, actions and disosition will be found of the best. 'he Clydes are great feeders and rarely ave sickness.

I speak, as will be noticed, more of hires and Percherons, not because hey are best of the draft breeds, for ll have great merit. I know these wo breeds from personal experience. believe it is poor policy to mix stablished breeds and for this reason elieve in staying by the breeds that he mares carry the blood, of so remain a breeder of Percheron and hires.

A Percheron was the only recorded tallion in the neighborhood when I egan as a farmer, twenty one years go. I began to raise horses as soon as owned a ranch. Yes! I am now f age as a "farmeress," last month reached my majority. It has been full and happy life, I do not regret hat my life lines have fallen on the arm rather than in society, that it as been passed among a people that work rather than among those that play. The man in blue jeans is wholesome and true. He may not be cultured, but he is sterling. He respects womanhood, and can be relied upon to help a woman to the end. The hand hardened with daily toil is an honest one. His mind is not soaked with sophistries and he sees life as a tangled wed in which much is good, mingled with the weakness of mankind.

MILK VEINS SUPPLY THE UDDER.

The interesting subject of the use of the milk veins which lead from the belly of a cow to the udder, is thus discussed by Hoard's Dairyman.

A few years ago we thought we would see what percentage of the farmers out of one hundred believed that the large veins on the belly of the cow, which are called milk veins, were really veins for conveying milk to the udder. So without expressing any opinion of our own on the matter we simply asked the following question of one farmer after another:

"Why are those veins called milk veins?" The answer from 90 out of the 100 was in effect like this: "Because they carry the milk to the udder." Of the remaining ten, five could not give any answer except to say that they did not know, while only five had the right idea, viz: that these veins were in reality great blood vessels returning blood from the udder to the heart. Afterwards we conversed with several of the original ninety on the subject, and stated to them what science really had found out and as to the purpose of those veins. In almost every instance, however, we found them adhering steadfastly to their former ideas. One of them declared that he had cut into the veins on a dead cow and had seen the milk flow out.

Now, this is but one of several errors concerning the physiology of a cow which are strongly believed in by farmers. To be really intelligent and well informed, to believe in the truth and a mass of errors, on any question concerning living beings, one must make a study of them. Can we afford as farmers to be harboring a mass of unfounded notions about so important an animal as the cow?

If we believe the truth as it really exists, that these veins return the blood to the heart, it will teach us several valuable lessons:

(1.) It will show us the enormous circulation of blood that is required to produce milk in a good cow. (2.) It will teach us that we must take good care of the udder, for with such a heavy influx and outpour of blood the organ is very sensitive to abrupt changes of heat and cold. This is the reason that cows are very apt to have garget by lying on cold ground late in the fall; also by lying on stone or cement floors. (3.) It will teach us the folly of tying cows in the common stanchion whereby it is easy for a standing cow to step over onto the teats or udder of the cow that is lying down next to her. We should wisely provide a system of tying cows in the stable that will prevent such serious injuries. (4.) A knowledge of the true physiology of the udder will teach us the importance of careful and gentle usage of it in milking and the great importance of attending to any derangements at once, which may take place.

There is no reason on earth why every farmer who keeps cows should not be a well informed man on the physiology and function of the dairy cow. Such knowledge would prove a very profitable guide to the wisest and best methods of handling the cow.

We should always remember that the highest profit from cows can only come through the use of the best judgment and the best methods. To have good judgment we must have sound knowledge, for as said the ancient proverb:

"Woe unto him who believeth a lie."

PIGS ON THE FARM.

The question of pigs on the farm should be gone into by every farmer. Some people may regard the injunction as unnecessary, but it is a fact that one does come across some farms destitute of any pigs. This is a mistake, especially where there are dairy cows, with the usual output of skim milk, when from cheesemaking, and other things which could not possibly be used to greater advantage than in feeding pigs. No one who has noticed the average piggery will attempt to deny that there is room for great reform in the matter of housing and general treatment of the pig.

As a rule, pigs are kept, fed and cleaned in a more or less neglectful fashion. Swine fever, that dreaded plague, would be almost, if not altogether abolished, and with it many restrictions that are often laid down, if there was systematic cleaning and housing, proper feeding, and no overcrowding. As it is, the careful pigkeeper, who looks after his animals properly, suffers with the neglectful one, who is really a party to the mischief.

Good alfalfa hay is nearly equal to good bran, ton for ton. You can raise a ton of alfalfa cheaper than you can buy bran. If you live where alfalfa will not grow, then raise clover, or cow peas, or vetch. Raise those crops you know will do well in your locality.

For a Good, Practical Milking Machine see the O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

STRENGTH
DURABILITY
SIMPLICITY

A cream separator that is worth buying must give **long service.** To do that, it must be built strong and the **construction** must be simple. To have simple construction in a separator you must have a Sharples Tubular. There is no other cream separator made that will perform its work so well for so long a time as the **Tubular** because there is no other separator so strongly built, or so **simple** in construction.

Sharples Tubular Cream Separators

get all the cream, have low supply can, are easy to run, easy to clean, because there is only one little piece in the bowl to cleanse after each running, and the machine oils itself. It combines **Utility, Simplicity** and **Durability.** A glance at the pie-plate construction of most separators will give you a fair idea of what we mean by "simple construction" and "strength." For full information about the Sharples Tubular write for booklet E. 260

Mr. R. Carpenter, Davenport, Wash., says "Having used a Sharples Cream Separator over sixteen years can say it is just fine."

702 No. Main St., Los Angeles

Queries

Rough Milking?

Can you tell me what is the trouble with my cow? During the summer she began stepping around while I was milking, as though the operation was painful. I attributed it to chapped teats, and tried dry milking, then vaseline, but the trouble slowly increased till now she keeps her hind feet constantly going up and down during milking. Would like to kick, but is too well brought up.

The udder does not seem sore; is not swollen or inflamed, but the squeezing or pulling of the teats seems painful. At intervals, for the past three months, there have appeared small pink spots on the teats as though the skin was knocked off, but would soon heal up to re-appear in a day or week or more.

Lately there has been small lumps appearing at the base of the teats or between them on the udder; soon break and heal up. Only two or three of them have appeared and are no larger than the end of a lead pencil.

If she keeps growing worse will be unable to milk her. Her milk seems to be all right, likewise herself, though she seems a little thin in flesh. These spots and lumps dont seem to cause the uneasiness as they appear only occasionally.—Subscriber San Martin.

Try castor oil on the teats, I fear from the little intimation given of wet milking that you are not particular about cleanliness. In many places the health officers refuse to allow wet milking. From it I further judge that if you had been a gentle milker, one with the smooth velvet suction, instead of having a grasp on the udder, these troubles would not have arisen.

Begin by washing the udder clean and greasing the sore spots with castor oil. Wipe the udder and then pare your nails carefully, wash your hands and dry them and sit down to milk. Go slowly and milk gently; if the cow is restless give her a little bran to eat and stop the milking for half a minute. The reason for the washing is to avoid infecting other portions of the udder with the trouble. The lumps and spots appear occasionally only because the hurting pressure has not been severe enough to produce them at other times. Those between the teats were infecting from the others in all probability.—M. E. S.

Cream Separators, all sizes, all prices. See O. J. Weber Co., 555-557 So. Los Angeles St., Los Angeles.

Overeating.

My cow, three years old last fa was picketed on volunteer oats; wou occasionally get too much and a dull and persist in grunting, thou not what might be called sick. H had no oats for about two months. feed alfalfa hay, nice, fine whe straw and about one gallon roll barley twice a day and she now h occasional spells as indicated abov

She vomited this morning, seem better tonight and gave quite a goo mess of milk. She has comfortab quarters.

What is the matter with her, ar what can I do for her?—T. B., Oak dale.

I presume this cow is over-eatin weigh her out not to exceed fiftee pounds of the alfalfa hay and th same amount of wheat straw. Divid into two parts and feed it with he barley. Then let her alone unt night and give the rest of the fee

If she is a very large cow and be gins to lose flesh or drop in her mill add a little more to her ration, in th hay line. I never like to feed a much rolled barley as that to a cow half of it with a couple of pounds o corn would make a more digestibl feed, or else half barley and hal bran would do better.—M. E. S.

Lump on Belly.

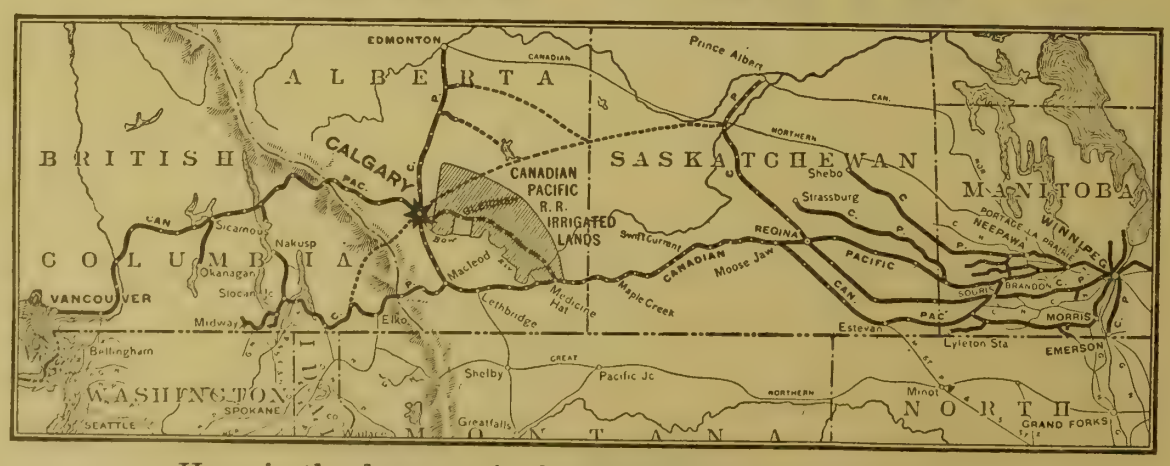
We have a cow with a lump on her belly between the udder and nave the size of a soup bowl and is hard We have bathed it with warm water rubbed it with turpentine and olive oil and poulticed it.

We opened it a month ago. It started 3 months ago and water run a first, but now has stopped and is still hard.

Cow is alone in the barn at night and in the yard daytimes.—R. H. R., Elsinore.

If the opening has not closed up, I should go to the druggist and get peroxide of hydrogen, he will give you the proper strength. I would inject it with this to start healing from the base. It if is closed up I should simply let it alone for nature to absorb in time.—M. E. S.

SOME FACTS



Here is the largest single irrigation project in America.
Here is all the water you want for 50 cents an acre a year.
Here grow the largest average crops in America.
Here grew the highest prize wheat at Portland Exposition.
Here have been grown the sweetest sugar beets.
Here cattle fatten without being fed all winter.
Here are good schools, churches, folks and fine climate.
Here you can buy good land cheap NOW.

THE GUERNSEY IN POPULAR FAVOR.

There is no better index of the growth of the Guernsey interests than the increase of the Register. Great as this increase appears for an extended period the records of 1906 show more entries and a larger number of transfers than in any preceeding year.

Volume 17 of the Herd Register begins with this January number. When the quarterly issues of the Register were started with Vol. 6 in January 1905, the Club had been in existence seventeen years and there had been published 3572 bulls and 7080 cows. During the last twelve years there have been published 7612 bulls and 13,778 cows, or twice as many entries. This makes with the beginning of this volume 11,185 bulls, 20,859 cows in the Register, or a total of 32,044 animals.

There were 2706 sales recorded in 1906, or 400 more than in any previous year, and against 652 twelve years ago.

DAIRYING ON HIGH-PRICED LAND.

Economy of production is the motto of the exponent of dairying on high-priced land; or, in other words, the economy of high-priced land means the ability of the owner to secure maximum crops therefrom. Successful dairying is a pursuit that is cumulative in its effects; that is, within certain limitations the longer dairying is practiced the greater means of production are provided. Herein lies the foundation for the statement, "the cow fattens the land." Under proper management she is certainly not a soil robber. A good cow generously fed will not only yield a handsome direct profit, but, if the by-product is properly conserved and applied to the land, three-fourths of the value of the food she consumes will be recovered in the form of plant-food. She is indeed a veritable gold mine.

It is a self-evident fact that to dairy successfully on high-priced land, it must be practiced in the most modern fashion. When we refer to high-priced land we mean land worth all the way from one hundred to two hundred dollars per acre. Ordinary methods of dairying will not suffice on such land. Common cows with indifferent care would be out of place here. Even the usual system of pasturing would scarcely be profitable. Soiling should take the place of the pasture, thus maintaining three or four times more cows to a given area. Conditions are highly favorable for soiling over a large portion of Oregon. There are few winters in which green feed can not be secured in the open field all winter, west of all Cascade Mountains. This means an unbroken supply of succulent feed throughout the year. To reach this, however, the dairyman must plan a rotation that is in harmony with his enviroment. In alfalfa-growing sections this is an easy matter, as this forage-plant, when properly established, can be relied upon for furnishing green succulent feed for at least five months without any thought of the dairyman as to seeding or cultivation.

To illustrate the possible production of cow feed from twelve acres, the following rotation and acreage are given: One acre of rye and vetch will yield ten tons of green feed and the land can be planted to corn after the spring crop is harvested and will yield five tons of forage. The two acres of alfalfa, when well established, will yield at least three cuttings, yielding in the aggregate forty tons of green feed. Two acres of fodder corn will yield twenty tons. Four acres of vetch and oat hay will yield sixteen tons. Two acres of kale will yield sixty tons, and one acre of barley will yield sixty bushels of barley and two tons of straw for bedding. This in the aggregate will give 135 tons of green feed, sixteen tons of hay, a ton and a half of barley, and two tons of straw. This is sufficient rough feed to supply fifteen cows for one year. By purchasing thirteen tons of mill feed, at a cost of $325, the whole amount of feed required for a herd of fifteen cows for one year will be supplied. A good cow should yield a gross return of $100 annually. Thus the ten acres can be made to return $1175 annually for labor and investment.

This result may not be reached for the first few years, but with a careful selection of the herd and a thorough conservation of the by-products of the farm, even better results may be obtained.

In dairying, as in any other vocation, the personal equation of the dairyman is an important factor. Every phase of the industry must be conducted upon modern business principles. There may be, and doubtless there is, a good field for the dual-purpose cow, but not on high-priced land. The special-purpose cow is the only cow that should grace the intensive dairy-farm.

Every detail of the industry must be mastered. A full measure of cleanliness and comfort should be provided for the cows, which means that the rigid stanchion should be regarded as a relic of barbarism. The barn need not be an expensive one, but it should have plenty of light and good ventilation. Under the soiling system the cows are in the barn a goodly share of their time, thus the sanitary conditions of the building should be good.

Kindness Produces Results.

There is no class of farming where kindness and punctuality will receive a greater reward than on the dairy-farm. The modern cow is an exceedingly complicated piece of animal mechanism. Hence for best results her guardian should by all means possess an amiable temperament. Harsh treatment will ruin any high-class herd.

It is generally conceded by observant dairyman that a cow which freshens in the fall will yield 25 per cent more profit than if she freshened in the spring. Thus from a financial point of view the bulk of the herd should freshen in the fall. Considerable depends also upon the management of the cow at the beginning of lactation. When the time for maternity approaches the cow should be placed in a clean box stall nights. After the ordeal is over the little calf should not be permitted to remain with its dam over six hours, twelve hours at the very outside limit. This is an important item in the management of the cow. It is the opinion of many up-to-date dairymen that every day a calf is allowed to remain with its dam, up to a certain limit, it decreases the annual value of the products of the cow $1. The cow should be fed very sparingly with concentrated feeds for several days. When she begins to regain her normal condition and the udder becomes soft and pliable, the ration of mill feed should be gradually increased until a full feed is reached.

There is no question but dairying can be made profitable on very high-priced land, but to reach maximum profits every detail of the industry must be carefully observed.

This active, pulsating, living piece of mechanism—the modern cow—is the emancipator of poverty and the harbinger of peace, prosperity and civilization; thus henceforth let us give the place of honor to this gem of the farm.—Address by Dr. James Withycombe at the meeting of Oregon Dairymen's Association.

ROSE GARDENS.

Roses are wanted for bloom, not for the effect of their foliage or for their foliage or for their beauty as bushes. Therefore they should be grown in a garden by themselves, where they can be tilled and fertilized in order to make them produce a good crop. They need as much care as corn or potatoes. They should be placed in the flower-garden, not on the lawn.

Mike—Pat, kin yez tell me what kapes them bricks together?

Pat—Sure, Mike; it's the mortar

"Not by a dom sight; that kapes them apart."

Teacher—Johnny, do you know the effects of alcohol on the cells of the brain?

Johnny—Naw, but I know de effects on de cells of de station house—

The Ornamental Garden

By ERNEST BRAUNTON

SEASONABLE SUGGESTIONS.

THE increasing warmth will start every dormant plant into action and spring, as far as vegetable growth is concerned, comes with a rush in California, and now is the time when you must hustle with your gardening.

Clean Up.

Get rid of all rubbish, dead weeds, etc., so that when the spring crop of garden pests hatch, they will find less shelter. It is also true that such a cleaning up removes many insects in a dormant state, their eggs, and often both "bird and egg."

Save Moisture.

As there is always considerable doubt about the rain supply, see that the soil about your plants is so disposed as to catch the needed amount in case it should fall. After each rain, and before the ground is too dry, hoe, and if possible rake all your cultivated ground, to retain the moisture as long as possible.

Prune Roses.

Roses may be pruned and manure spaded in any time during the month. In March they will begin to sprout for the spring crop. Do not prune such climbers at the present time as Double and Single Cherokee, the Banksias, Beauty of Glazenwood, Gold of Ophir, etc., as their bloom is produced all along the branches. The best time to prune these is after their spring crop, when they will have time during the summer to grow long branches for bloom the next season.

Fertilize Lawns.

Fertilizing of lawns may be done this month, as we seldom get weather cold enough after the latter part of February to check it, although March is equally as good.

While natural manures are best for cultivated ground, we cannot advise [illegible] too rank unless you now have a lawn so [illegible] can harm it. Unless natural manures have been thoroughly and repeatedly turned over and mixed each time of wetting, you cannot be sure that it does not contain some live seeds of pernicious weeds, Bermuda grass, etc.

DO THIS NOW.

This is the best time of the year for general garden planting; plant out citrus trees, loquats and all fruit and ornamental trees and plants from semi-tropic or tropic climates; manure lawns, and plant out gladioli; fertilize and cultivate roses and prune out useless wood.

PLANT SCREENS.

Many annual plants make effective screens and covers for unsightly places. Wild cucumber (or echinocystis,) cobea, and sweet peas may be used to decorate the tennis screen or the chicken-yard fence. The alley fence, the smoke-house, the children's playhouse, may be screened with morning-glories, flowering beans, and other twiners and climbers. The windows may be screened and decorated by vines grown either in the ground or in the window-boxes.

Efficient screens can be made of many strong-growing and large-leaved plants, of which castor beans, sunflowers, cannas, tobacco and other nicotianas, striped or Japanese corn are the chief.

GROWING CHRYSANTHEMUMS.

In growing 'mums, as in all other highly developed flowers, one should have an ideal, and in this connection it is as well to state that there are at least three types, somewhat different in effect, that are striven for by all 'mum growers.

Single Blooms.

If you want a few large flowers such as you see at the shows, you can have only one stem or three at most to a plant, and only one flower on a stem. Pinch off the young shoots as soon as they show themselves, so that the plant can never branch. If you are successful you will have the beauty of an individual object. It will be a wonderful thing and may not fit in with anything else, but will demand attention for itself alone. Remember that size alone is vulgar, and that the delicate and fanciful may be made gross and characterless by overfeeding.

A Few Blooms.

Do you wish enough size of flower so that you can recognize the variety and are you willing to sacrifice numbers? Then you would better aim to produce about four flowers to every plant or stem.

These branches should be as long as possible and therefore you should pinch out the central shoot of the young plant when it is five or six inches above the soil and make it branch. Teach it to cherish a high ideal—the ideal of four fine flowers, each at the top of a long branch.

A Fine Plant.

Would you like a handsome, symmetrical, bushy plant with twenty or more flowers? Do not try it, expecting great success with little care. The flowers will be small, sometimes partially developed, and so lacking in character that you can scarcely ever tell the variety. It also takes too much tying and training and disbudding, and the result is more or less artificial and has no artistic value for effect. Skilled gardeners can do it, but it costs more time than most people can give. The plants must be started early and fed with great care.

General Pointers.

Size and color form are the products of disbudding. Everybody has some color sense, but the conscious pleasures in form is a later development. However, it ought to be said that imperfectly blown flowers of chrysanthemums often have a beauty in mass effect. They are rarely painful, as is a partially blown dahlia. This is probably because the fully developed flower in one case is loose and free, while in the other it is often set and formal.

Whatever ideal is chosen, the best way to begin, in general, is to buy young plants of the grower. Young plants of any size from two to twelve inches in height can usually be had any time. New and desirable varieties are appearing so rapidly that the amateur may well trust to the grower for a selection of the best and most adaptable kinds.

"Why do the wild waves rage?" she cried;

"I do so long to know."

"Because you stepped," the wretch replied,

"Upon their undertow."

The Vegetable Garden

By ERNEST BRAUNTON

CONTROL OF APHIS.

NO INSECT is easier of control than the common "green fly" if it can be confined, but when it "roams at large" it is of course a serious problem and one that baffles the skill of the gardener.

The best method of dealing with these pests is to keep them off the plants. It is a poor gardener who is always looking for some easy means of killing insects. If the plants are carefully watched and every difficulty met at its beginning, there will be no occasion for worrying about aphis. A fumigation with tobacco smoke twice a week will keep them away, but if the fumigation is delayed until after the lice have curled up the leaves, the gardener will likely have a serious task in overcoming the pests, and the plants may be irreparably injured in the meantime.

In the greenhouse aphis never becomes a serious pest for a ten-year-old boy with a handful of straw and a few damp tobacco stems may with three light fumigations, for three successive nights get rid of all of the little insects. Of late years even this means of dealing with the problem has been simplified, for liquid tobacco preparations may be procured, poured into a vessel, a hot iron dropped in the liquor, and the smoke that arises will soon dispose of Mr. Aphis. In nearly a score of years of greenhouse experience, however, the writer never saw a serious case of damage by these insects in a glass house and one who knows it is indeed shiftless.

When these pests are in the open field they are very difficult to deal with for the common green fly will give birth to about fifty live young every twenty-four hours (during a small portion of the year only do they lay eggs,) and these will begin to breed when three days old, so that the increase seems to be almost incredible, thereby adding force to the old saying that "a stitch in time saves nine," when dealing with aphides.

Some persons, under the impression that these insects are leaf eaters, spray their plants with a solution of paris green or other poisonous ashes, while still others claim the insects do no harm because they do not eat the leaves. All the insects of this family are sap suckers and their mouth parts are not made for biting, but furnished with a long proboscis which is at once both a drill and a pump.

In the field they are combatted in two ways, either by spraying with kerosene emulsion or soap sprays, or by fumigation. With plants standing near of the ground either a liquid or dust spray is used, but with a low, rose rate plant like those of the melon family, the pests seem most easily annihilated by covering the individual plant with a cloth under which a small quantity of carbon bisulphide has been placed in a saucer. Neither this insect enemy has yet been found to effectively hold them in check

DO IT NOW.

Cabbage and cauliflower plants, and roots of asparagus, and horse-radish, may be planted at once; sow beans, peas, tomatoes and turnips; plant potatoes; plant onions, New Queen for early, Portugal for later, and Yellow Globe, Danvers and Australian Brown for main crop.

TRUCK GARDENING.

Before the introduction of commercial fertilizers, and the completion of railroads, the market gardening or trucking business could never have been developed. Forty years ago no one thought of growing vegetables for market away from the immediate vicinity of a large town, where a plentiful supply of stable manure could be always obtained.

Even after the use of artificial fertilizers had become common among farmers, and their use had developed the cultivation of some of the varieties of vegetables, such as peas and potatoes, on cheaper lands away from the immediate neighborhood of the large cities, the gardeners in those places could not be brought to believe that as good results could be had from the use of fertilizers as with stable manure.

And so until a very recent period the gardeners around the large cities thought that for their use stable manure was essential. But even these men have found out that the same results can be had more cheaply by the use of commercial fertilizers, in connection with a leguminous crop buried in the soil, to take the place of the organic matter in the stable manure.

Growing Onions for Seed in the Santa Clara Valley

LIME AND ITS USES.

Lime is one of the essential elements of plant food which must be in the soil to enable any plant to grow. But for all the purposes of plant food many of our arable soils contain an almost inexhaustable supply. But lime has been found to have a value in the soil apart from its use by the plant as food direct.

The chief of these uses, in a soil well stored with decomposing vegetable matter, is in promoting the growth of the nitric ferment organisms that change parts of this organic matter into nitrates, and thus makes the nitrogen or organic matter available as food for plants.

Lime also corrects injurious acidity in soils, aids in the breaking up of insoluble compounds of potash, thus rendering that base available to complete the work of the nitric ferments, and also has an important mechanical effect in the soil.

Wild hogs are reported near Red Bluff, and are being trapped and sold in the local market.

A NEW SWEET POTATO.

The California Experiment Station at Berkeley has come into possession of a new sweet potato, of which the following account is given:

Macomber's sweet potato is white-fleshed, and was obtained on Pagan Island, one of the Ladrone group, by Capt. J. A. Macomber, of Oakland. Capt. Macomber was struck with the delicate flavor of the tuber, and when leaving Pagan Island took a supply of tubers aboard his schooner for consumption on his voyage. He noticed that the tubers had splendid keeping qualities, and upon his arrival in California in November he kindly donated what tubers he had left to the experiment station of the university. The tubers when we received them, were in a remarkable state of preservation, notwithstanding the fact that they had been lifted in April, some eight months previous. If this characteristic persists with the tuber when grown under California conditions, it will indeed be, as Captain Macomber surmised, a big boon to the sweet potato growers and consumers of California. The tubers donated by Captain Macomber have been propagated and a limited number of tubers secured for distribution. The tubers yield many more cuttings than does the ordinary type, and quite a large number of plants can be secured from a single tuber if properly handled. It is a very prolific variety, with a tendency toward deep growth of large tubers. Trial is necessary to determine its cultural and market value.

The California station distributes this potato by arrangement with the United States Department of Agriculture at Washington.

ARTIFICIAL FERTILIZERS.

Mixtures almost innumerable are now offered by the manufacturers of commercial fertilizers, each claiming special qualities and advantages for different crops. Some go to the extent of offering a special brand for each different vegetable crop. This is largely unnecessary, though some variations of the different elements of plant food is desirable for different crops.

The potato crop, for instance, demands more potash than the cabbage crop, and less nitrogen, and the same rule will apply to most garden crops, according to their growth below or above the ground. The three elements of plant food which plants get by means of their roots, and which are most apt to be deficient in cultivated soils, are nitrogen, potassium and phosphorus.

California Horticulturally

By JOHN ISAAC, Sacramento, California

THE SEARCH FOR PARASITES.

THERE is every probability that the work of searching for beneficial insects will be indorsed by the present legislature, and continued by the Commissioner of Horticulture. A bill has been introduced in both houses and has been very favorably received making an appropriation of $12,000 for this purpose. In its scope this measure is wider than the last law which confined the work to searching for beneficial insects. The new bill provides for the proper care and distribution of these insects when they have been found. The amount asked for for this work is a mere bagatelle compared with the sums given for other matters of vastly less benefit to the state, and any results at all will amply repay it to our taxpayers. It is good policy to keep a man in the field continuously searching for insect friends, and if once in ten years, even, he should find a thoroughly effective parasite of some destructive pest the cost would be compensated for many times over. Who can compute the value of the Vedalia cardinalis or the Scutellista cyanea? Beside these brilliant successes there have been many other minor beneficial insects introduced, the total value of whose labors are inestimable. We know of no more profitable expenditure of the public funds.

PERIODICITY OF INSECT PESTS.

Apple growers in the Pajaro valley are preparing to fight the Canker worm, the Tussock moth and the codling moth; the three worst insect pests with which their orchards are afflicted. The Tussock moth appeared in unaccountable numbers last year and became a serious pest for the first time in many years. This insect has the habit, which very many of our pest have, of appearing at long intervals and in different sections in great numbers and then of almost wholly disappearing again and not being seen for many years. In our Californian experience we have known several such visitations where the Tussock moth threatened to become a most serious pest only to quietly disappear again after giving the growers a good scare. This disappearance is due largely to the numerous parasites which prey upon this caterpillar, aided perhaps by unfavorable climatic conditions for propagation. The Tussock moth especially has many parasites which attack it, and it is quite probable that even after numerous visitations of the pest to the apple orchards of Pajaro Valley last year, they may almost entirely disappear this summer. It is also true of our California locust that they seldom appear in destructive swarms for two seasons in the same locality. When our native pests appear in destructive quantities in any one season their natural enemies seem to breed in increased ratio and overtake them, and it takes several years for them to increase in sufficient numbers to become serious again. There are also various climatic conditions which may be favorable or unfavorable for the increase of the pests.

Stranger—What are your terms?

Hotel Clerk—Rooms one dollar up.

Stranger—I'm a poet and I want—

Clerk—Oh, in that case our terms are one dollar down—

A PURE FOOD LAW.

A strong effort is being made to get a stringent pure food bill through the present session of the legislature, which will supplement the federal law. There is no class to which this measure should appeal more than to the farmer and fruit grower, for they are caught by adulteration in two ways; both in what they buy and what they sell. There is hardly an article used in the household or on the farm which does not suffer from the fraud of adulteration or substitution, for which the farmer has to pay, while in the market many of the articles produced on the farm are doctored so that the price of the genuine product is so lessened that it hardly pays to grow them. Olive oil may be instanced in this case. It is doubtful whether genuine olive oil can be produced, taking into account all the expenses of growing, picking, pressing, bottling and marketing, etc., for less than a dollar per quart bottle, yet stuff labeled "Genuine olive oil" can be bought for one-fourth this price. Wines have been doctored to the detriment of the grower; prunes are doctored and filled with water after they leave the producer's hands, and so without end, and it all tends to lowering the price of the grower's products and to make him poorer. Certainly every producer should favor a pure food law.

TOO MUCH RAIN.

It is an old saying that it never rains but it pours, and such has certainly been the case the present season. The ground is soaked to its nethermost depths and it will be some time before the farmers in the upper part of the state can get to work in the fields. There has been no time between storms for plowing and the season is passing rapidly with little grain sown and little farm work done. We often suffer from dry seasons and have short crops for lack of rain, but this year it looks as though we should suffer from the opposite cause and have no grain and little hay because we have had too much rain.

FEDERAL ENTOMOLOGICAL WORK.

Congress has increased the appropriation of the Bureau of Entomology in Washington in order, among other things, that it may study the work of the destructive thrips in California. This work will be welcomed by our fruit growers as the thrips has been increasing in its destructive work for some time threatens to do much damage in the future. This insect is exceedingly minute and does its worst work in the blossoms of the fruit trees which it attacks, destroying their fertility and so preventing the proper setting of the fruit. It has so far been found very difficult to combat it, and it is to be hoped that with the aid of Washington experts we may reach some effective modes of keeping the pest within limits. It is not improbable either that work along these lines, started by the federal authorities, will be continued in other lines and our fruit growers have the assistance of the best entomologists in the country, which means in the world.

It has been decided to adopt electricity as the motive power on the Denver & Rio Grande railroad, the electricity to be generated by mountain streams along the line.

THE FARMER AND THE ADVERTISER.

THE CAREFUL study of modern calalogues by the more intelligent among the farming population, is one of the remarkable indications of the time. It is only less remarkable than the careful and discriminative reading accorded to the advertising sections of the truly reliable and worthy farm journals. The profits which accrue to the growers and their families, and to the manufacturing and mercantile communities of the country, from this habit of weighing carefully the claims made by various advertisers, are almost beyond computation; and it points to the passing of the idea that all rural residents are "suckers," the easy victims of "gold brick" and "green goods" frauds, and so devoid of judgment and common sense that they separate themselves from their money upon the flimsiest of pretexts.

Another benefit to follow this development of independent judgment is the elimination, to a large and increasing extent, of objectionable and fraudulent advertisements. Likewise, the same influence is felt in the more careful preparation of advertisements and catalogues designed for the farmer's reading.

Many of these are veritable works of art, and there are not a few which rank as masterpieces of literary style.

THE CULTIVATOR "points with pride." There is not a single unbroken record left in the shop. More subscribers, more advertisers, more compliments, and fewer complaints than ever before. Also, more good reading matter—for we have been forced to add extra pages, a part ot the time at least, to make room for the unprecedented business. And there isn't an ounce of "boom" in it—just plain every-day sawing of wood into proper lengths for farm consumption. The compliments, too, come from all sources—from pleased subscribers and gratified advertisers.

The kicks—(we get 'em sometimes of course)—well, they just make us take a fresh grip on the old buck saw and plant our foot a little harder on the log. Talking about saws, that reminds us of the "old saw" that says something like this: "When we please you, tell others; when you have a kick coming, tell us." It's good advice; try it.

ANOTHER "point—(with pride.") That is the quality and character of our advertisers. Once in a long while we hear a complaint of unfair treatment of a subscriber by an advertiser, but very, very rarely. When a complaint is made it is investigated, and steps taken to prevent a recurrence.

Not all advertisements offered are accepted—be sure of that; but there is not a member of the Cultivator staff who thinks he is infallible, and mistakes do occur. But we are proud of our advertisers, and we believe in them; on the whole, they are representative people, and safe to do business with.

A Bunch of Beauties.

THE CULTIVATOR takes occasion from time to time to direct the attention of its readers specifically to some of the catalogues which are sent to its offices by various bidders for the ranchman's trade. We have before us at this time nine beautiful booklets of exceptional merit, from the International Harvester Company of America, Chicago. The value of these booklets lies in two things; first, the full and complete picturing of the machinery, in minute detail; second, the lucid and understandable descriptive text. Some of them also contain valuable tabulated statistics. The man or woman who will give thought to these books, can determine, without excessive labor, whether his purchases should lie in this direction. The subjects include cultivating machinery, harvesting machinery, dairy machinery, gasoline engines.

Some Hen Figures.

Anyone with a liking for statistics may get some glorious facts and figures out of Uncle Sam's annual report on farming operations. It gives a first-class idea of just what we are doing in the way of feeding ourselves—and the rest of the world. No one has a just conception of the immensity of American farm products until he reads such a report. Take the poultry industry—annual production about 45,000,000 crates, or 1,472,043,730 dozens, or 17,664,524,760 individual and separate eggs(worth approximately $130,000,000. These figures are amazing, yet in spite of this enormous production, it is still a fact that eggs are constantly advancing in price. The hen man needs to wake up to this fact if he aims at the highest possibilities in his business; for until this increasing demands is met and passed, prices are bound to rule higher. This being true, it is manifestly wise to take any and every course that will help production.

No better thing can possibly be done to increase laying than giving a healthy tonic in regular daily doses. All hens, and young chicks as well, need just this help in order to produce the most, or make the satisfactory growth. Nothing better for the purpose can be found than Dr. Hess Poultry Pan-a-ce-a. Thousands of successful poultrymen from all parts of the country testify to the wonderful value of this tonic. Dr. Hess(M. D., D. V. S.,) has for years studied every possible condition which may exist in poultry culture, and has given the world his Poultry Pan-a-ce-a as a result. For those who do not know about this tonic let me say, it does not force egg production by exciting or stimulating the fowl unnaturally. Instead, it makes digestion in the hen an easy and natural process, so that every grain or spoonful of mash eaten either makes eggs or flesh as Nature intended, and in the largest possible amount.

Those who use Dr. Hess Poultry Pan-a-ce-a tell us that it does positively cure and prevent disease. No flock can be sickly where it is used, because it makes the red blood which Nature requires for health. And also the necessary nitrates to carry off poisonous matter from the hen's system. By the use of this wonderful tonic, chicks are matured much earlier than would otherwise be the case; and pullets come into laying when eggs are highest and continue profitable the entire season. The cost of Poultry Pan-a-ce-a is a mere trifle compared with the great result it brings about. One cent's worth will feed 30 hens a day. Dr. Hess and Clark, of Ashland, Ohio, who prepare it, back Poultry Pan-a-ce-a with a written guarantee, so there is no risk in trying it. It is abundantly proved that if you use it as directed and occassionally sprinkle hens, roosts and nests with Instant Louse Killer, your flock will be free from disease and uniformly profitable.

Piles Cured In 6 To 14 Days.

PAZO OINTMENT is guaranteed to cure any case of Itching, Blind, Bleeding or Protruding Piles in 6 to 14 days or money refunded. 50 cents.

The Paying Hen

is the one which contributes 150 eggs or more in a year, toward the family grocery bill. The sure way to have such hens, eggs in abundance, and a lot of ready cash is to give a little of

DR. HESS
Poultry PAN-A-CE-A

with the morning feed **every day in the year.** Dr. Hess Poultry Pan-a-ce-a is a tonic, the sole purpose and action of which, is to assist nature in the performance of necessary functions. It aids digestion, prevents disease, and sends the proper proportion of each food element to the organ most in need. It also contains germicides which destroy bacteria, the usual cause of poultry disease. Poultry Pan-a-ce-a is the prescription of Dr. Hess (M. D., D.V.S.), and is a guaranteed egg-producer. Endorsed by leading poultry associations in United States and Canada. **Sold on a written guarantee, and costs but a penny a day for 30 fowls.**

1½ lb. package, 35c. 12 lbs. $1.75

GOOD ROADS LEGISLATION.

The article on the above topic, from the pen of James W. Abbott, for many years special good-roads agent of the United States Department of Agriculture, will be read with interest.

Aside from the fact of Mr. Abbott's experience along this line of work is his intimate knowledge of California conditions which appertain to building public highways. Seldom have we been able to obtain such valuable suggestions from so wide an experience. The suggestions offered for guidance of our present legislature will appeal to the public as eminently practical at this time.

The recommendation for a highway commission charged with the responsibility of state-wide action, is worthy of careful consideration. The suggestion for raising money by direct taxation on all property is in line with the operation of many eastern states now pushing the good roads movement.

Mr. Abbott, who is a mining engineer of large experience, would be a most excellent member of a state Highway Commission, having practical experience and technical education to render him a most valuable acquisition to such a body.

In line with Mr. Abbott on good roads building in California, is Mr. J. H. Reed, known to horticulturists as the "grand old man" of Riverside. In a recent letter to the Cultivator, he says:

"I feel confident there is a new era in good road building in Southern California, that will see wonderful results before it closes. You should feel no little satisfaction in having had so much to do individually and through your paper in getting the good work started. And let me serve notice just here. As soon as your good roads enthusiasts get your improved roads started, Mr. Braunton and several of the rest of us tree planting enthusiasts are going to follow you up with highway beautification and comfort, with the result that in a very few years Southern California will have a system of roads, for comfort, for speed, for beauty and real enjoyment, not equalled in the world, and the beauty of it all is, it will prove to be the best paying asset in a pecuniary way, this Southland will have."

WHERE APPROPRIATIONS COUNT.

In some of the states of the Union the legislatures are debating the proposition of expending large sums in the erection of capitol buildings. Notably this is true in Maine, where it is proposed to build a capitol edifice that shall be a monument to the enterprise of the residents of the Pine Tree State.

Naturally the question arises, whether more is to be gained in the way of advertising a state through expensive public buildings or by money expended in road making, experiment stations and other things which have for their object the advancement of the conditions of the rural population.

It is a mooted question whether grand capitol buildings have much influence in attracting residents, especially so if other important considerations which effect the prosperity of the farmer be neglected. In this age of practical agriculture the trend of effort is toward the bettering of farming conditions. Good roads have come to be regarded as a living necessity. Lands are desirable in proportion to their ability to produce and their proximity to active markets. Farms located on well-made highways are vastly more desirable than those hedged in by bad ones, and the seeker for a farm, nowadays, looks as much to the access of the market and the comfort of travel, as he does to proximity of rural schools.

Experiment stations are a vital necessity, not only in new states where conditions are undergoing radical changes, but in older states where worn out soil and pests as enemies of horticulture have practically rendered a new line of action imperative for the farmer.

In our judgment, money expended in extending relief to farmers, and in educating them to new and improved lines of work, as well as money expended on highway betterments, will be conducive to better results in advertising a state than in monuments of stone in buildings.

WHERE CALIFORNIA ATTRACTS.

The coming of Ex-Governor Horace Boies of Iowa, to California, with his colonization scheme, is only an index of the sentiment of the East on California immigration.

The fact that such a man as Governor Boies should become interested in our state, at his age, to the extent of purchasing thousands of acres of farm lands in one of the richest counties of our commonwealth, and placing upon them a hardy stock of Norwegians and Swedes, is the best possible proof of the value of California lands as they are viewed today by practical farmers of the East.

Mr. Boies owns several thousand acres of land in Iowa. He is very wealthy and an up-to-date farmer and stock raiser. He has determined, it is said, to purchase holdings in Tulare County and to become personally interested in the formation and operation of his colonization project.

He will bring with him several hundred people who will locate on his lands, as actual settlers, and proceed to farm them under approved conditions. We all know that Norwegians and Swedes are excellent farmers, good citizens and good people, and while they are socially somewhat "clanish," they stand for good schools, good roads and honest government.

The point, however, in this instance, is the turning of public attention to California, as a state where agriculture can be carried on with profit. It has only been a few years since the people in the East regarded our state as simply a place for the rich to locate, where the assets are climate and fruits only. It was tabooed as a poor man's country, the claim being made that it was a good state to spend money in but a poor one to make money.

Of late this notion has largely disappeared. The agricultural returns, as published in national and state reports, has demonstrated that more money can be made on 40 acres of California land, with vastly less labor, than can be made on 160 acres in the Middle West. Then the people have awakened to the fact also, that life is worth a good deal more under the balmy sun of California than in the ice-bound regions of the middle and western states All these conditions are producing their certain results, and they are turning the heads and hearts of thousands upon thousands of easterners to this land of oranges, lemons and cultured agriculturists.

STOCK IN MINING SCHEMES.

Not long since the Cultivator was besieged by a mining firm of Tonopah to run an advertisement in its columns, upon investigation it developed that the scheme was purely a stock gambling scheme and of course the advertisement was rejected, as all advs. of doubtful character are.

Our object in calling attention to this matter, at this time, is to warn our readers not to be inveigled into buying mining stocks on the flashy advertisements which appear in the newspapers. Nine times out of ten they are fakes pure and simple, and the person who invests in them loses his money. At present there is a widespread, almost insane stampede on the part of people anxious to get rich quick, to mining stocks; and the result will be, as it has always been, that millions of money will be lost in investments which are worthless.

The Farm, Stock and Home is advising its readers, just as the Cultivator does, to beware of their fake schemes of mining stocks.

In a late number it says:

"Observations extending ever many years fail to reveal a single instance where a scheme that was extensively advertised, with the view of making sales of stock in amounts of ten dollars up, ever resulted in anything but dead loss to investors. Opportunities to invest in legitimate business enterprises have been advertised and small investments solicited, that proved to be safe and remunerative to the extent of a reasonable or even liberal interest on the investment, but only in cases where careful investigation would prove the proposition to be legitimate, business-like and honestly conducted. Putting money in the hands of strangers whose alleged intention it is to invest it in a hole in the ground from which mineral, oil or some other natural wealth is to come forth in unlimited quantity; or in some mythical railroad scheme, a great invention or similar airy nothing, is sitting down to a gambling table where confederated thieves with stacked cards are pitted against one outsider, and what his chances are in such surroundings he should have no difficulty in understanding."

The farmer who thinks he has any surplus money to spend had better use it in improving his home place. He may be certain that every dollar he puts in, in the way of improvement, will add to the selling value of his farm. He has a sure thing in this method of acquiring wealth whereas in the mining deal he stands but one chance in a thousand to win back a dollar. He is simply played for a sucker.

The wet season will start the weeds along the highways. Improve every spare hour in cutting them down. Remember a tidy place, clean fence corners and good roads add five dollars an acre to the land.

The Cultivator appears again this week in 32 pages. We are necessitated to enlarge from time to time to let in our advertising patrons. The Cultivator gets returns for its advertisers. They say so, hence the demand for its space is increasing.

News of Country Life in the Golden West

Southern California

AGRICULTURE.

Heber has a new cantaloupe association.

Alfalfa is ready for harvest in the Imperial Valley.

Many acres of asparagus are being planted in Imperial valley.

One shipper sends 300 boxes of rhubarb a week from Saticoy.

There are 127,400 acres of crops now in the ground at Imperial.

A carload of new machinery has arrived for the creamery at Imperial.

A thousand acres is to be planted in beans on the Santa Margarita ranch, San Diego county.

Coachella valley claims the first cabbages in the market. The crop is estimated at seventy-five cars.

Imperial valley receives $25,000 a month for the milk of 1000 cows. The Imperial Standard is authority for the claim.

The Ontario cannery is planning for the largest business of its history the coming season. It will add tomatoes to its pack.

A carload of shelled corn has been imported into Imperial valley presumably for seed. The crop will be used to fatten stock.

Many wells all along Base Line, of which there were formerly a great many, are flowing as the result of the unusual wet season.

A carload of poultry food in the form of small shells was shipped from Bolsa Beach last week, to the northern and central part of the State.

Brawley is promised a new packing-house and shipping shed to be erected for cantaloupes, grapes, watermelons, tomatoes, cucumbers and other products.

Apricots are blossoming and indications are good for an average crop, provided there are no heavy, dashing rains or strong winds while the crop is setting.—Redlands Citrograph.

Gold nuggets found in a Buff Cochin hen's crop in Los Angeles caused a flurry in the minds of the owners of rival breeds. There is good money in poultry without the nuggets, and less risk.

Reports from the celery field at Huntington Beach indicates a loss to date of 900 carloads, on account of the car shortage, with no relief in sight. If the situation continues unimproved for thirty days the loss will amount to over $200,000.

George L. Wagner reports a rise of thirty-four feet of water in his well on his potato plantation at Anaheim since the rains began falling the last of November. The well is only 140 feet deep. Mr. Wagner will plant 200 acres to potatoes this year.

The surveyors have reached the top of the mountain in making the preliminary survey for the wagon and automobile road over the mountain range from Glendora to the San Gabriel river just below the forks. The engineer reports not more than an 8 per cent. grade.

The Jesus Maria ranch has been incorporated. The ranch consists of 30,000 acres in the Lompoc valley. The oil rights are held by the Union Oil Company. The capital stock of the new company is $500,000. Los Angeles will be the principal place of business.

Within a month the farmers will begin cutting barley hay, that crop now booming ahead as never before. There should be eight and possibly nine full cuttings of alfalfa this year, and there is stock on hand to transform it into butter, beef and pork, for all of which bumper prices are being realized.—Imperial Standard.

Articles of incorporation were filed last Friday with county clerk of San Bernardino county for the Exchange Packing House company, the incorporators being James Barnhill, Earl F. Van Leuven, W. W. Wilcox, J. B. Hanna, L. C. Newcomer, Wade Purdum and T. E. Moon, all of Colton, and W. S. Bullis, of Los Angeles. Capital stock is placed at $10,000.

HORTICULTURE.

Redlands rainfall for the season is 15.53 inches.

Corona has shipped 193 cars of citrus fruit this season.

A landslide near the reservoir at Lompoc has crippled the water system there.

L. W. Coleman has sold his ten-acre lemon grove to a Pasadena investor for $11,000.

Fifty thousand grape cuttings from Riverside are to be planted in the Mesquite Lake region.

The Camperella bifuscati, the Chinese imported enemy of the red scale, is being tested at Riverside.

A Los Angeles man has patented a new can making machine, which completes the can in one operation.

The rainfall for February 16 at Highland was .92 of an inch, making a total for the season of 18.04 inches.

A break in the pipe of the Bear Valley line has deprived ranchers in that section of water. Repairs are being rushed.

The Monrovia-Duarte Fruit Exchange has declared a dividend of $1.35 per box for oranges on the December pool.

The crop of 200 acres on the Santa Ana river, to be planted in peaches, is reported as having been contracted for ten years at $25 per ton.

The Auburndale tract is to see tried the experiment of raising walnuts. About eighteen hundred trees are soon to be set out on the tract.

The wages of orange pickers at Highlands has been advanced by a large number of the growers from $2 to $2.25 per day.—Imperial Standard.

Sage honey will be scarce in the Riverside section this season. The bees are resorting in quantities to the almond trees now in bloom in Riverside.

The Tustin packing house is busy and keeps packing steadily. It is handling both the Mediterranean sweets and navel oranges, shipping nine or ten cars per week.

The San Joaquin Fruit Company, which has such large holdings and which is acquiring such a splendid water system, has just finished planting 500 acres to walnut trees at Santa Ana.

Frank A. Tetley and J. W. B. Merriman, are getting ready to plant sixty acres of grapes near Imperial, the greater part of which will be Malagas. About five acres will be planted to Black Cornichon.

Address your mail to Prado, if you mean Rincon, for that is the new name given to the postoffice and railway station at that point. Rincon has given place to a decidedly less picturesque sounding name—Corona Independent.

The largest vineyard planted in the Imperial Valley will be that of Stone Brothers and Pashgian, who are getting ready to put in about three hundred and fifty acres, mostly Malagas.

Several Riverside men are making preparations for planting a large acreage of grapes in the Imperial Valley.

Hemet valley ranchers are putting out fruit trees in great numbers. As orange trees are very scarce, not more than half the acreage that has been prepared will be planted. There is much talk among the ranchers of increasing the acreage of olive trees, as olives grown on the Hemet tract are free from scale, and the price has greatly advanced.

H. E. Bothin, a capitalist of San Francisco, has purchased Park Hill, a range of hills in the center of the Hemet Valley. A well-known landscape gardener, has laid out Park Hill in a series of driveways and boulevards on a most elaborate scale and has located two artificial lakes 350 feet higher than the town of Hemet. Ornamental shrubbery will be placed throughout the park. Mr. Bothin has plans for an Italian villa of fourteen rooms.

Northern California

AGRICULTURE.

Volunteer hay is appearing in quite respectable quantity above Clovis.

Farmers are rushing seeding at Pleyto.

Two power plants are busy constructing dams, flumes and ditches, at Springville.

Crops in the vicinity of Florin are growing nicely. The ground is too wet for planting.

Six thousand acres has been laid out in small blocks 25 miles north of Bakersfield.

C. B. Purvine of Petaluma, has received two thoroughbred heifers from Golden, Colorado.

A reinforced concrete bridge is in prospect over Putah Creek, Yolo and Solano counties, at Winters.

Hundreds of carloads of slate for roofing and tiling are shipped from Placerville to San Francisco.

More than 2,000 tons of grain have left the Soledad warehouse during the past sixty days, going north.

The Ocean Shore railroad has applied for a franchise for freight and passenger traffic through Watsonville.

Red Bluff. Sheep-men are receiving a better price for their sheep this season than they ever received before.

Poultry raising is coming to be quite an industry about Pleyto, and these parts are well adapted for that pursuit.

Prof. Loughridge of the University Agricultural college, has recently been investigating the soil around Porterville.

Springville has been nearly shut in from the outside world for the past six weeks owing to the bad condition of the roads.

King City has had 13.67 inches of rain for the season to date this year, as against 13.38 inches for the entire season last year.

A number of farmers in the Schellville district are constructing a telephone line to connect with the Sonoma rural system.

The Associated Poultry Keepers of Santa Cruz county, is one of the newest organizations for the promotion of the poultry industry.

The Hanford Sentinel says that a "vegetable condensing" factory is about to be opened at Armona, beginning with thirty tons of onions.

A corps of surveyors is at work on the Roca ranch, San Benito county, running lines for the immediate installation of an irrigation system

There is much activity in the dairy business in the vicinity of Corcoran and Angiola, and the new creamery at Corcoran is having a steady run.

At Lockwood it will be imposible for the farmers to get all their summer-fallowed land sown owing to the wetness of the land in that section.

Fifteen thousand sacks of potatoes are reported on hand in Pajaro Valley, at $1.75 to $2.00. The price in ordinary seasons is 95 cents to $1.10.

The Santa Cruz papers report the sale of the Patrick Morrissey ranch of 94 acres, located on the Soquel road, to syndicate for $50,000—$530 an acre.

Plowing for the sugar beet seeding is in progress at Chico. The ground is turned to a depth of 12 inches, and several thousand acres will be planted.

Dr. J. H. Haile of Winters, who owns the colt Delmer D. by Demonio 2:11¼, dam Babe by Dawnlight, believes he is the largest colt of his age in the state.

Ten head of cattle were killed by the County Veterinarian in Tulare county last week. Ten more were placed in quarantine. Texas tick is the cause.

The San Benito county seat is agog over the near arrival of a competing railroad—and the projected construction of a cement and pottery factory, near San Juan.

HORTICULTURE.

Orange picking is still progressing at Exeter.

Tulare county is organizing a fair association.

A fruit cannery is being talked of at Hanford.

Three loads of apples were marketed from North Tulle last week.

The rainfall for the season to Feb. 5, in San Lucas is 14.40 inches.

A large crop of volunteer grain hay is growing this season at Clovis.

Sowing grain and planting trees is the order of the day at Live Oak.

Lemoore claims 1987 acres of bearing orchards and 3225 acres in vines.

Foundations are being put in for the dairy building on the State farm at Davisville.

Many large tracts of land about Clovis are being surveyed into small holdings.

At present the prospects were never better for a large fruit crop around Woodland.

A carload of Jersey cattle was shipped last week from Pajaro valley to Dos Palos.

About a thousand acres are being set out in vineyards around Arbuckle and College City.

A peach cannery is promised for Sunnyvale, to employ 800 persons during the season.

One hundred acres near Madison are to be set to vines that will produce a wine grape.

The Philippine papaya will be tested in Tulare county from seed sent from the islands to Mr. J. N. Birkhead.

A mass meeting of fruit growers and packers is soon to be held in Watsonville to discuss methods of marketing.

The Angiola country is looking fine since the rains and there is considerable inquiry there by prospective land buyers.

One almond grower of Pennington is putting out thirteen acres more this spring, and about forty acres will also be put out by his neighbors.

One hundred and four cars of oranges from the Exchange packing-house at Sanger is the record for the season up to Feb. 11. The crop is unusually large.

The chief business about Centerville at present is picking and hauling oranges. On account of the bad weather very few of the oranges have been placed on the market.

From ninety Royal Anne cherry trees on his ranch near Vacaville, Mr. Chubb reports sale of cherries to the amount of $2200, or an average of $24.40 per tree.

Tehama county orchards this year have been greatly increased by the planting of young trees. Thousands of young trees have been shipped here from the nurseries and set out this spring. The Phillips cling seems to have been the favorite.

A farmer and orchardist near Hanford says that the old peach trees show the blight very much and he does not think spraying will save them. There are many orchards 13 to 15 years old, some that have been bearing for a dozen years.

The largest wine shipment from Santa Clara county in ten years has just left for New York City. It comprised 125,000 gallons of wines of the varieties of Zinfandel, Burgundy, Cabernet and Carignano. The consignment was sold for 16 1-2 cents a gallon, aggregating $33,125 and representing one season's product of 300 acres of vines.

Up to a recent date the total shipments of oranges from Butte county amount to 212 carloads—112 carloads shipped from Oroville and 100 from Palermo. These cars have brought an average of about $800 a car, the total value of the shipments made over the Southern Pacific to the present time being approximately $169,000. A number of carloads yet remain to be shipped.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and brood. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for greatest batch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904—Petaluma Incubator Co., Petaluma, Cal.: My Dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be isued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. FILCHER, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

You can win with my stock and eggs because I have won and am winning. Matings this year very fine. Inspection invited. Write me your wants. **Eggs $2, $3 and $5 per 15.**

Profit in the Poultry Yard

By Mrs. A. Basley, Hollywood, Cal.

SUCCESSFUL POULTRY INDUSTRY.

AT THE Farmers' Institute, last week, at Panama, near Bakersfield, Mr. W. E. Deacon, one of the successful poultry men of Bakersfield gave us some of his experiences in the egg business, which were so interesting that we print his paper almost in full, so that others may be encouraged to go and do likewise. Mr. D., in talking over the matter after the session, said that his 1500 hens netted him about $3000 a year, a comfortable income of $2.00 a head per year.

Mr. Decon's Egg Factory.

In discussing this question from the standpoint of practical experience, I am obliged to confine myself to one branch of it only, that of producing eggs for the market, and the marketing of the young roosters and the hens after they have passed their prime as machinery in the egg factory.

You will please pardon me for speaking of an egg farm as an egg factory, but after nine years of experience in this business, associated with my sons, and that with marked success for the past six years at least, this idea of a factory is ever present with me when I am thinking on the question of how to make the hens pay a large profit on the money invested in our business, and it is my opinion that the egg factories of this country will in the next ten years exert a greater influence in the framing of the pure food laws of the United States than any business in which the farmer is directly interested. You ask how this can be. I will tell you.

Egg Inspector Needed.

The people who are engaged in the industry of producing eggs for the market, the merchants who are handling our product, and the consumer as well, all realize that we have absolutely no protection on this the most important industry in this or any other highly civilized country. (I include now all branches of the poultry industry.)

Investigation and statistics will prove the truthfulness of my assertion. The Government has it's meat inspectors in every city of any considerable size, but who ever heard of an egg inspector? And yet it is just as important to have pure eggs as it is to have pure meats. Some may ask, "Are not all fresh eggs pure?". Not by any means. Just in proportion as the hens are properly cared for and fed good, pure food, or neglected and fed on all kinds of rubbish and filthy food, will you have fine flavored and pure eggs or bad flavored and impure eggs. If the chicken houses are not cleaned regularly and disinfected at frequent intervals, and the hens given the best of food, they can not remain in a healthy condition very long, and an unhealthy hen can no more lay pure eggs than a sickly cow can give pure milk. Now, is not this practical common sense? Certainly it is.

How the Farm Was Started.

Now I will return to the question as stated in beginning. Is an egg farm profitable in Kern county? My answer is, yes. And I also firmly believe that the more egg factories we can start in the county under a good management, with a county organization that would maintain an egg depot with cold storage facilities, the more profitable will be the industry in the county, and the more thrifty ranchers we shall have in this vicinity, and fewer sickly wives and daughters. This last declaration almost impels me to give away a little family secret. Yes, I will do it, with the understanding that none of my hearers will carry the news to Mrs. Deacon. It is this:

My wife bought a pen of fifteen hens and a cock of thoroughbred Brown Leghorns of Mrs. George Ware nine years ago, and from these the first season raised 175 as fine pullets as any one would wish to see, and from this small beginning has developed the Deacon Egg Farm. It came about in this way.

I came to Kern county from Indiana on account of my wife's health and also that of my own, and Mrs. Deacon bought those first hens from Mrs. Ware so she could have something to do in the open air and something to think about that would draw her mind from her poor health. Now, at the age of 53, she is enjoying better health than she has for thirty years, and we have our poultry business paying us a handsome profit on the investment. In this connection I will also relate to you something that is no secret in our family. My wife, by her good judgment in restoring her own health by the open air employment, has worked out the problem of what I have termed, "The Poultry Raising Cure for Nervous Prostration and the First Stages of Consumption," and it has in the past two years saved the life and restored to health our eldest daughter, who came from Indiana to us in the fall of 1904, a nervous wreck, and in the following spring broke down completely. After being treated by a good physician for three months, her mother took her to this same little place where she started our poultry ranch, and for one year gave our child the "Poultry Raising Treatment." Today she is well and hearty, when eighteen months ago she did not have one chance in a hundred to live three months, and I assure you this is no fairy tale either.

Good Blood Necessary.

The secret of success in egg production is first to have pure blooded stock (we believe the Leghorn is the bird.) Secondly, to give the flock the best of care, and, thirdly, to feed them a properly balanced ration.

The only way to produce a flock of good layers is to begin with good stock, and then select from your entire flock the very best layers, and place them in pens for the breeding stock. Do the hatching entirely from the eggs thus obtained, being careful to sort out all imperfect, or ill-shaped eggs. Place none but perfect eggs in the incubater or under the hens. Then you can rest assured the young chicks will come out strong and vigorous, when with good care and proper feeding the pullets will mature early and make the fall layers, when eggs bring the highest market price. In the care of a flock of laying hens, to obtain the best results, it is very essential that the chicken houses should be cleaned at least once a week, and after cleaning sprinkle the floors (dirt floors preferred, with air-slacked lime. Spray the inner walls with distillate once a quarter, at the same time paint the roosts with a mixture of Kern county

crude oil and the distillate to keep the houses free from vermin.

When the flock has been properly bred and well cared for, then the all-important test comes to know how to feed so as to produce the eggs at all times of the year, except during moulting season which should be in July and August in this climate, and have the hens ready for laying by September when the highest prices obtain.

Method of Feeding.

Our method of feeding and that which has always given us the best results, is known in poultry journals and papers as the balanced ration. It consists of a mash to be fed each day early in the morning, composed of bran, middlings, cornmeal, oil-cake meal, meat meal, and bone meal in exact proportions by weight, all mixed together thoroughly while dry. Then add enough water by weight also, and mix well again, and have this mixture so it will not crumble too much. By this method you know exactly how many pounds of the mixture we have to distribute to the flock, allowing usually about one ounce to the hen. This constitutes the forenoon meal for the entire flock of layers. The hens should be given enough of this mixture to last them until 1 o'clock in the afternoon. For the evening meal each hen is allowed about one ounce of Egyptian corn in the fall and winter seasons, and a like amount of wheat instead during the summer, with an abundance of fresh water, and free access to good Eastern ground oyster shell, grit and granulated charcoal, with free range on the green alfalfa at all times.

Future of the Industry.

Now a flock of, say 150 hens, bred, cared for and fed in the manner I have described will approximately earn $65.00 per week from eggs alone for ten months in the year, with an additional income of from $300.00 to $600.00 annually from the sale of young roosters, and hens that have passed their day of usefulness as layers. This is calculated on the basis of our home market, as it has existed for the past six years. But permit me to say that just as soon as the Kern county poultry men wake up to the needs of our home market and realize the fact that in a very few years, the City of Los Angeles alone is sure to have a million of people to feed, then we can easily increase our net profits on poultry to the extent of thirty per cent. or more, and every farmer's wife and daughter who will engage in this industry can have a good bank account.

I have been watching the rapid development of the poultry industry in California, for several years, and I am sure we enjoy many natural advantages in this vicinity for the production of a first-class quality of eggs and poultry for the market. Many other sections of our State lack the good alfalfa ranges which furnish green food at all seasons of the year for our poultry, and here we have but little rain, much rain is always hard on the poultry business, especially when fresh eggs are scarce. The best grade of eggs bring from 50 cents to 75 cents a dozen in the fall in the large cities of the Pacific Coast. I candidly believe from my experience that no industry will at all times so surely yield a large per cent. of profit for the capital invested as the poultry industry in Kern county. I will make the prediction that within the period of five years our own people in Bakersfield and Kern City will call for the best quality of eggs and poultry, will accept nothing less, and the farms of Kern county will furnish the product. And our own merchants will, instead of being compelled to ship in thousands of dollars worth of eggs every year to supply the home market, be able to supply our near-by large cities with immense quantities of the best quality of eggs and poultry.

No mater what kind of food may be selected there is no combination suitable for all purposes. First, determine what you intend to do and then feed accordingly. One should not feed as much protein to non-producers as to layers, as the production of the egg demands that the hen should have food rich in protein. The setting hens, males and hens that show no inclination to begin laying do not require as much protein nor as much food as the layers. It may also be added that the growing chick must be supplied with foods rich in lime (such as bone,) as wel as with a suffiiciency of protein, as growth is evidense that it is producing flesh and bone. pullets also require more protein than the matured hen, and there arrives a period when the matured birds will not demand as much food as when younger.

GOLF.

A stick and a ball and a wee, small boy,
A whack, and the ball is off;
A walk a mile; then do it again,
And that is the game of golf.

Chicks Just Hatched

We ship them everywhere. Pure Bred White Leghorn Chicks from the Best Egg Producers in the United States

CALIFORNIA INCUBATOR CO., MAXWELL, MAY 27, 1906.

Gentlemen—The little chicks arrived in perfect condition. It is very remarkable that 600 little fellows would come so far and being so long on the way without the loss of a single one, but it is an undisputed fact that such was the case. We are thinking of getting a few more providing we can get them right away. Answer by return mail. Yours truly, J. F. CAMPBELL.

CALIFORNIA INCUBATOR CO., 907 Washington St., Petaluma, Cal.

GROWING OF YOUNG CHICKS.

What to do with and how to manage chicks from a month old up, is oftentimes more of a problem than how to feed and care for them at first. In fact, brooders and prepared poultry foods have made it comparatively easy to bring chicks to what is known as the "weaning" stage, but after this there comes a time when a change of food and quarters must be made, and it is at this time that many poultry raisers suffer serious loss. As a rule unless the brooder is crowded or needed for a younger brood, chicks may be allowed to continue to occupy it nights until five or six weeks old. A longer time, however is not advisable, and more roomy and open quarters should be provided at this stage, or if weather is warm perhaps a little earlier. Unsually I transfer my chicks to summer quarters when about five weeks old, although I have occasionally done so from one to two weeks earlier with equally good success.

It is the poorest kind of policy to allow growing chicks to hunt up a change of quarters for themselves This they will do if neglected too long, taking up their nightly abode in shrubbery, trees, and machinery sheds about the premises. Chickens out of place are an intolerable nuisance, nor are there any animals on the farm harder to reform in this respect than these. In this vicinity there are tobacco curing sheds on almost every farm, and for some reason poultry seem to prefer them to any other place and are a nuisance, for they always will appropriate them to their nightly use. After the tobacco is put in, chickens are a damage there and yet, although one year's flock may be gathered up and sold at a sacrifice to get it out of the way another is often allowed to take its place the next. Such trouble and annoyance as may be made in this way might easily be saved by moving chicks at the proper time to some more suitable building.

By this I do not exactly mean that one should move them directly to permanent quarters, although if not filled up with old stock this may be done. In case the old flock has been broken up and scattered about in breeding pens and other summer quarters the young flock may advantageously take its place at once, but where the houses are already full, it is only inviting disastrous loss to crowd the young in with the old. In this case it is much better to provide small colony houses to be occupied until the old flock can be disposed of, or until the approach of cold weather makes it necessary to transfer again to warmer buildings. This is really the very best way of all where the little summer houses are available, but ordinarily, they are not on the farm and some other means of housing chicks during the developing period must be provided.

Scratching Pens.

A good plan and one I have always found satisfactory is to move them from the brooders to the scratching rooms attached to the main buildings. These are roomy and can be closed entirely or in part, making it easy to confine them for a few days after transferring, until they become accustomed to their new home, and later allowing them to pass in and out through openings too small to permit the grown birds to enter. Grain is thrown on the floors in clean litter and the young can scratch and eat at will without being robbed or disturbed by the old. This enables one to feed generously and keep up a steady growth, thus bringing the young stock to maturity at the earliest possible time. Midsummer losses, inevitable where young and old are housed and fed together, are avoided and the young stock does not annoy the farm owner by roosting in buildings where they are not wanted.

In these scratching rooms, of course, are no permanent roosts. For the accommodation of the young chicks, very low perches are temporarily put in These are broad enough so that they can sit comfortably on them and about six inches above the floor. A 2x4 studding timber makes an excellent perch and for a number of weeks, one perch twelve feet long will easily accomodate all the chicks taken from any one brooder. In time however another will be needed and the first should be also raised a little.

In connection with roosts it might be well to say that a regular spraying with kerosene oil is very essential in order to keep down mites and other vermin. If the roosts and droppings under them are thoroughly soaked with oil occasionally mites will not trouble and really there is nothing so detrimental to rapid development as these pests when once they become numerous enough to be troublesome. It is almost impossible for a chick to eat enough to more than support its body and the mites without anything to promote growth. Mites must be kept down if vigor is to be kept up.

Food for growing chicks should consist largely of mixed whole grains. Wheat and oats together with some corn and buckwheat should be scattered in litter and at this stage chicks should be given all they will eat. Grit and clean water are also essential and should not be overlooked. Coarse shorts wet with milk is excellent for an occasional change and in fact may be fed freely to good advantage. With roomy quarters, freedom from mites, and plenty of food chicks should develop very rapidly, enabling the owner to dispose of the culls and cockerels while the price is yet good and to put the pullets into the best of possible shape for winter egg production.

MRS. MINNIE HONAKER.

One of the main causes of failure with poultry raisers is the lack of cleanliness in the hen house. Dirt breeds insects. Clean the hen house daily in winter and empty ashes on the floors. Grit in winter is indispensable. Vegetables, meat, oats, wheat and bran should be fed alternately Give boiled potatoes for one meal a day. Plan for the comfort of the egg producers and use them so well that they just can't help laying. Keep only active hens. Did you ever stop to think what a wonderful piece of mechanism a hen is? What a tremendous strain there is on that frail looking thing we call a hen! Shouldn't we give them the best care and attention? And if we do this how grateful they are and how hard they try to tell us of it.

NATURAL CAUSE.

A scientist, in the employ of the government at Washington, recently met his physician in the street.

"I don't know what's the matter with me, Doctor," said the man of science. "I am limping badly today. Do you think it's locomotor ataxia?"

"Scarcely that," replied the physician. "You are walking with one foot on the curb and the other in the gutter."

EFFECT OF LAYING COMPETITIONS.

In his report on the Australian laying competition, Mr. Thompson, who has charge of the competitions, says: "The egg-laying competitions have undoubtedly increased the production of eggs very much. Many people thought that the effects of booming egg-production would paralyze our egg market, and that eggs would become a drug on the market. The competitions have not done this, but they have shown poultry-breeders how to increase their egg-yield, and get a maximum return from a minimum expenditure of labor and feed. Early breeding has become general rather than exceptional, and the greatest increase has been in winter eggs. Good egg-producing strains are fast becoming disseminated throughout the whole State (New South Wales,) and the market remains as good as ever, with still $200,000 or $250,000 worth of our own State trade to capture.

"The egg-laying competitions have broken down the old methods and substituted the new. The old method, which is still continued on our general farms today; the new methods brought out by our laying competitions only as yet have been adopted by the specialist poultry-farmer. The general farmer allows his poultry to run promiscuously together, in number and sexes, and to roost anywhere and lay anywhere. The old method means losing money, from the fact that at times fowls are overfed and at times underfed. Both produce low returns and encourage disease, and the result from the ledger spells loss.

"The competitions have demonstrated that dividing hens up into small lots, providing them with good shelter from wind and rain, and with plenty of good seasonable feed, varied in character, with good breeds, early breeding, and breeding every year, this loss can be turned into large profits."

One might think Mr. Thompson was writing about conditions in this country. His word rings true even on this side of the earth. The conditions he describes would apply with us in many cases.—Poultry.

A POULTRY EXPERIENCE.

We live on a small farm of eight acres and raise Single Comb White Leghorns. My poultry account appears small after reading in the paper where one man gets an average of two and one-half eggs per day of a hen, for a whole month. I have been keeping an account of what my small flock has done for the past three or four years, what it cost, and what I got for my work. For one year, commencing December 2, 1905, from eight 1-year-old hens and one hundred pullets, April and May hatching, I received 13,316 eggs. I sold eggs to the amount of $149.41, at prices ranging from 10 to 25 cents per dozen. Four hens were set, which hatched fifty-three chicks and raised forty-five. These furnished us all the fried chicken we wanted, with twenty pullets left for another year as producers. I now have 170. I lost 36 hens during the last year from various causes.

During that time I fed 129 bushels of corn costing $46.10; 20 bushels buckwheat at $8.95; 51 bushels oats at $12.39 making a total of $67.40. In addition to these grains we fed 10 bushels of carrots and garden beets which cost us nothing but the labor to produce.

The hens have a range of six acres, of which two acres are in pasture and the other four are farmed. The net amount received above cost of feed is $81.97. This is not including the fowls and eggs used by the family.—Mrs. Huldah M. Malone, White County, Indiana, in Farmers' Guide.

CHILDREN LIKE POULTRY.

The poultry editor of the Cultivator, has a little grand daughter, four years old, who is developing into a practical chicken raiser. She seems naturally to take to poultry, and poultry to her. It is so with children in general.

Here a suggestion may be made with profit.

The farmer that doesn't have time to look after his poultry is losing money, because, if he only realized it, his hens are one of his greatest sources of revenue. If he doesn't have time personally to give his fowls the attention they require, he should turn the work over to his wife and children. Women generally enjoy taking care of poultry, but often their household duties are so numerous that they cannot do as much as they would like. Then, to use a slang expression, "it is up to" the children to do it. If the farmer will do the heavy work, it is safe to predict that his wife and children will see that the poultry gets all the care it requires. By giving a child a hen and telling her she can have all the profits she earns from the chicken, she not only becomes interested in the work of caring for poultry, but learns to save money. The sole care of the poultry should not be turned over to children, however, because they are prone to neglect unless they have an overseer.

POULTRY IN CHINA.

While the Chinese are perhaps the most successful poultry raisers in the world, says Consul-General Rodgers, at Shanghai, according to natural methods, they are also undoubtedly the most economical in the business. The foreigner, seeing the immense, number of ducks, chickens and geese of the country side, naturally assumes that large amounts of grain and other poultry food must be consumed. Yet, investigation reveals the fact that the Chinese consider the fowl perfectly able to pick up a living without much assistance on their part, and as a consequence herding is practiced, each flock being kept on the move, as sheep are on a range. It is true that at some periods of the year the fowls are fed, but the food given them would be considered chaff in other countries, and is practically worthless. The natural result of this is poor poultry, but that is the rule and standard in nearly all China. It is an absolute fact, moreover, that the gleaning of the paddy fields by the flocks of ducks, which often contain several hundred, is a distinct benefit to the Chinese farmer. As in all other methods of life, the poultry-raising process is another wonderful exhibition of the marvelous economy of the Chinese. Indeed, it may be said that the frugality of the Chinese in such industry, as compared with the prodigality of others, is an excellent illustration by which to measure the radical difference between the Chinese and all other races in the production of wealth. In view of these statements, China can not be considered a promising field for the exploitation of American poultry foods, unless there should come a great increase in the value of the product and a reversal of established custom, neither of which is likely to occur.

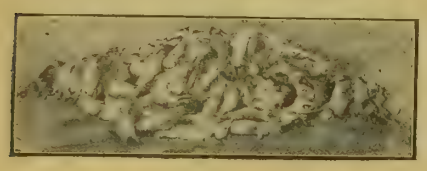
Now is the time to go for gophers with Bille's Gopher Poison. The gophers go for it and it will go for them good and plenty every time.



This is a photo of 201 killed in one day on a ten acre field before they could get back to their holes, with one bottle of

BILLE'S GOPHER POISON

Endorsed by Agricultural Colleges and Experiment Stations. Not one of the ordinary poisons, but in a class by itself. Has had greatest success in the Middle West. The secret being that it is most attractive to gophers, squirrels, etc., and sure death to them. It gives the grain a glossy coating, retaining the poison for weeks. Hundreds also die in their holes by eating it there. We have bought the patent rights for this section and are selling at the eastern price of $1.25 for large bottle. The ingredients cannot be bought at a drug store for that price. Money refunded if not as represented—so printed on the bottle. If your dealer does not keep it send $2.50 for two bottles, express prepaid by us. Anyway send for circular with affidavit of above killing, and a few out of many testimonials.

Compounded under Bille's patent by

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Cannibal Chicks.

I have a lot of incubator chicks that are nearly two weeks old, they were doing fine until they turned cannibal and picked the tails off of each other, they leave their feed to chase each other. I have to keep them in a darkened place, feed them well on chick feed, rolled oats, cracked corn and curd; do they need meat?

Please tell me what to do to stop their raids upon each other. I am afraid I will lose them all.—Subscriber, Dumbarton.

I am sorry to hear you have some cannibalistic chicks. Try to find the culprit that starts it or the few that are the ring leaders and isolate them.

The vice of cannabalism comes from their being idle, they get into mischief.

The only way to cure it is to give them meat, or beef scraps. Keep it always before them in a saucer or box, and make them scratch in alfalfa hay cut up in half-inch lengths, for their grain; give them as large a run as you can and supply them with growing green food such as a bed (or box) of lettuce, or growing wheat or barley, they will enjoy pulling these up by the roots.

Idle chicks are sure to get into mischief and brooder chicks must have occupations planned for them, as they have no mother to scratch for them and teach them.

This vice always comes from idleness and from a lack of green food and sometimes from a craving for animal food.—Mrs. A. B.

Orchard Fertilizers.

In the Cultivator of January 24th, on "Orchard Fertilizers." by J. W. Mills, Mr. Utter, conductor of Farmers' Institutes of Wisconsin is quoted as advising the use of simples as preferable to certain mixed fertilizers, and I would like to have further advice as to best time to use them on a lemon orchard, trees 12 years old.

In the fall of 1905 the orchard had a coat of stable manure. In the spring of 1906 a light application of bone meal and again in the fall just before seeding orchard to vetches.

Would it be best to apply some kind of fertilizer before or after plowing under the vetches? Advice as to the kind, quantity and best time of application will be greatly appreciated. —Subscriber, San Dimas.

We are sorry that we cannot give you any definite instruction as to quantity of fertilizer. About the best combination that we have had our attention called to, is an application of stable manure before the green crop is planted and the commercial fertilizer sown on top of the green crop just before plowing it under. A good many put in the bone fertilizer before sowing the seed. On most soils, legumes do better with stable manure to help them grow. It is usually cultivated in before sowing the peas or vetch seed. We have had good results by scattering it broadcast just after sowing the seed when it acts as a mulch and the rains wash it down when it also acts as a food for the green crop. On light soils the green crop will double over that without the stable manure.—J. W. M.

Grafting Peaches.

I have some one-year-old seedling peach trees, that I transplanted in January, which I would like to graft this spring. Which graft would you advise, the wedge or the splice?

Should the scion be of same size as the root, or if smaller, should it be set in center or to one side? When is best time to graft?

Would also like to know how many feet of the road is allowed for shade trees.—F. J. W., Kingsburg.

The wedge-shaped scion is the best in your case. Do not use a scion larger than a lead pencil. That is the best size. Make the inner barks match as nearly as you can and tilt the scion out at the top so that the change in position is scarcely perceptible. That will insure the matching of the bark in one place at least and that is enough to insure the flow of the sap from stock to scion. Wrap with waxed cloth and paint that over with wax. Clear bees-wax is the best when used under ground. Graft before the blossoms open.—J. W. M.

You will have to consult your supervisors about amount of road to be devoted to tree planting as we understand it, such things are regulated by the supervisors under state law in the country and by the city government in municipalities.

Orchard Questions.

Will you, in the next Cultivator, state the best method of grafting two-year-old walnut trees? Does the growth of moss on fruit trees affect the fruit production? If so what is the best wash and not injure the tree? If a fruit tree enters dormant state in dry condition does it absorb moisture during the dormant state?—J. H. S., San José.

Cut off the tops and graft the sprout with a tongue graft.

The growth of moss does not directly affect the fruit production, but it is a harbor for various fungus diseases and should be kept off by spraying with white wash or lime salt and sulphur.

There is no time in the life of a tree when it stops absorbing moisture. When the soil gets so dry that the tree cannot absorb any, it will dry up and die. When a branch is cut off in the dormant stage, this is demonstrated. Less moisture is absorbed when dormant than when growing.—J. W. M.

Sorghum on Alkali.

I have a small piece of ground which is quite strong with alkali. Would not sorghum be a good crop to sow on it? If so please advise me as to time of planting and manner of handling. I want to use some as a forage crop.—R. R., Fowler.

Sorghum was the first crop to grow well on land that was being redeemed from alkali. It is possible to have it too strong for sorghum. The time to plant is as soon as the frosts are over. April is about as early as I care to risk it. Prepare the land carefully by plowing and harrowing it fine, then sow it in rows close in the row; we drilled it in, making the rows three feet apart. It is cultivated between to keep down the weeds and if it checks in growth it is furrowed out between every other row and irrigated As soon as it is three or four feet high it can be cut, but not below the last joint. It will start to grow again at once. The best variety is the Early Amber, it does not make troublesome roots. Some varieties are bad as having roots that require a wagon to haul off the land. Try this and please report it back to the Cultivator to help the next one that is in a puzzle. You know we often help others as much by our failures as by our successes.—M. E. S.

Table Grapes.

Will you please let me know what variety of table grapes will do best on heavy soil. How far should the rows be apart and how far apart in rows at what age do they bear, and something about their cultivation? How many times should they be irrigated after planting.—N. E. M., Santa Ana.

Purple Cornichon, Flaming Tokay and Muscats do well on heavy soil. We favor rows ten feet apart and the vines eight feet apart in the rows for strong growing varieties. You should get some grapes the third year and a good crop the fourth year, with perhaps the exception of Cornichon, which is late in coming into full bearing. Plow once and cultivate till after rains are over and often enough after that to keep the weeds down. Irrigation depends on the soil. On some soils irrigation is not necessary. That is a question that you will have to work out yourself. It depends on your land.—J. W. M.

Oyster Shells.

Kindly answer the following question through your paper.

How much oyster shell does a White Leghorn hen need per year, if fed every day in the mash?

Thanking you in advance.—J. R. H., Arroyo Grande.

Oyster shell should not be fed in the mash, although I have once or twice done so for a very few days. Oyster shell should be placed in a small box or hopper before the hens at all times so that they can take what they require to make the egg shells. The hens require the lime to make the shells when they are laying and it altogether depends upon whether a hen is a prolific layer or not how much lime she requires. Scientists have found that the body of a hen contains from three to six per cent. of mineral matter when she is not laying, and from six to ten per cent when she is laying. If you mix the lime (oyster shell) in the mash the chances are that you will overdo it and give the hen indigestion, whilst if she can help herself as she needs it she will take the right amount and the probabilities are that she will eat about four ounces per year. It all depends upon what other food and what kind of grit you are feeding her.—Mrs. A. B.

Avocado.

Will you kindly inform me where I may purchase the avocado or alligator pear? I do not see it advertised in the Cultivator.—A. J., Santa Barbara.

Nearly all our advertisers have them or will get them for you. Any advertisers who will phone or write us that they have them in stock, will be sent the enquirer's address.

Standard of Perfection.

Do you still have the Standard? How much is it including postage? Is the Brown Leghorn male and female illustrated in colors or just black and white? Can you mention some book as a guide to mate Brown Leghorn to produce standard male and female?—M. H. V., Pomona.

You can get the Standard of Perfection at any poultry supply house. The price is $1.50. The Leghorns are not illustrated in colors in it. The book published by the Reliable Poultry Journal Publishing company, Quincy, Ill. called "The Leghorns," giving illustrations in colors and directions for mating, etc., is what you need. You can get it by writing to Quincy or at Henry Albers, 315 So. Main St., Los Angeles.

Fertilizer for Grain.

You will confer a favor to tell me through the columns of the Cultivator the kind of fertilizer to use for a light sandy loam for wheat and oats and how to mix and to use same. I have plowed the ground about seven inches deep and expect to harrow or cultivate grain in.

Would it do to sow fertilizer and grain after it was well up and harrow in, or will grain do better if fertilizer is sown with grain.—J. S. C., San Jacinto.

Use a fertilizer high in phosphoric acid and low in nitrogen and potash.

Use acidulated bone and potash.

Your soil may require a different amount than other soils, but we would suggest about 250 pounds of acid bone to 50 pounds of sulphate of potash per acre on one piece, a little more on another and a little less on another and in another season you will be able to instruct us. The bone will contain considerable nitrogen.

Drill the fertilizer in deeper than the grain.—J. W. M.

Bacteria.

Please give, in Queries and Replies, what information you can about bacteria for alfalfa, does it really increase the yield, and where the culture is used will the seed be more apt to grow?— A Subscriber, Lancaster.

The bacteria culture is useful only when the soil and seed are not inoculated. The seed is no more apt to grow by being inoculated with the culture, but it almost always induces a ranker growth even though the culture fails to inoculate the seed. This is due to fertilizer elements used in making the cultures. The young plants themselves draw on them.—J. W. M.

Green Alfalfa.

Kindly advise me through your columns if it would be advisable to plant alfalfa in runs for little chicks. Will it cause diarrhoea and has it any bad effect on little chicks.—T. H., Santa Ana.

Alfalfa is excellent in runs for little chicks, Nothing is better. It will not give diarrhoea, but the chicks will be likely to kill it off if kept on it too long a time. Little chicks should be fed green food from four days old every day to make good growth. It will not give them bowel trouble unless it is fed irregularly, that is if it is omitted for several days or a week and then suddenly a large amount is given, it may then at first act on the bowels, otherwise it will make them sturdy and give good growth. The rest of the ration should be properly balanced.—Mrs. A. B.

Calimyrna Figs.

In response to a request for information regarding the Calimyrna fig we beg to state that if your land is near the coast we hardly think it will be advisable to plant it as it requires a warm dry atmosphere in order to successfully dry this fig and in addition to this we fear that the figs would not mature properly in a location so near the coast as yours is.

We would not advise erecting a packing establishment where there is only a limited product to be handled as there are always commercial concerns ready to handle a product of this nature. In addition to this they are in position to pack and handle the product better than one individual who has a very small output at his disposal.—G. C. R.

Distillate Emulsion.

Does the Cultivator know of a formula for making a crude oil emulsion, such an emulsion as would be an excellent fly repellant; also I believe it the best thing I could use to spray my cattle with to kill Texas fever tick owing to its cheapness. I could use great quantities of it and by the use of a large force spray pump, could do so very effectually. Any information you can give me in regard to working such an emulsion, would be of great benefit to me and some of my neighbors.—S. S., Oceanside.

I do not know, but hardly think that the mixed compound in crude oil will emulsify, I cannot answer this question, but have sent it on to Prof. Jaffa and will send you his reply when it comes.—M. E. S.

Windbreak.

I would like to know through the columns of the Cultivator, what kind of a tree to plant for a wind-break something that would grow fast and still not injure the ground like the blue-gum? By answering, you will greatly oblige a reader of the Cultivator.—A. B. J., Santa Barbara.

As far as we know such a tree does not exist. Any tree that grows fast has to reach out and get its food in a hurry. That is what makes the blue-gum grow so fast.

You will find that fast growing trees do not root as deeply as slower growing trees, moisture conditions being equal. It is so with the different species of eucalyptus.

Soil Analysis.

Please let me know who analyzes soils, as I have some which I do not understand.—W. E. T., Lathrop.

You had best send to the State University for instructions how to take samples of soil for analysis. They make a light charge for the analysis, about $2.00 we believe, which is only a fraction of the cost. They do this, however, to protect themselves, for if no charge was made they would be overwhelmed with applications.

Hardiness of Walnuts.

How hardy are English walnut trees? Will they grow in Washington?—E. J. C., Fresno.

The trees are quite hardy and will grow either in the State or city of Washington (we don't know which is meant,) but may not grow nuts in either place. There are some sorts which bear well in the state of Washington, but are not the ones grown in Southern California.

Care of Young Turkeys.

I should be pleased if you could give an article on the care and feeding of young turkeys, as I think others besides myself would be interested. Your suggestion shall shortly be followed, but if you are ever in doubt "Consult Nature." What would Nature feed young turkeys where she hatches them, only in the months of April and May?—Mrs. A. B.

About Dogs.

Is there any periodical published on dogs in this state? Would like addresses of someone having pure-bred St. Bernards, for I have a bitch I would like to breed.—J. A. Wood, Clearwater.

We know of no dog paper in the state. Doubtless your address will be noticed by someone who has St. Bernards.

Drying Mushrooms.

Kindly advise me in your paper about the best method of drying mushrooms, especially chamignons. Thanking you in advance I am,—R. S, Redwood City.

We give it up, who knows?

Potato Blight.

I have seed potatoes from the north where the plants had the blight. Will they blight here?—V. D., Petaluma.

They certainly will. The blight is carried over in the tubers generally and the seed should be changed. If you have already planted, spraying with Bordeaux mixture on the tops will hold it in check, but do not again plant infected seed potatoes.

Bulletin 164.

I see in an article in your paper mention of an article on poultry in Farmer's Bulletin No. 164. Would you kindly let me know where to send for this.—A. K. S., Imperial.

Agricultural Experiment Station, Berkeley, Cal.

Eucalyptus from Seed.

Will you kindly tell me in the columns of your paper how to grow eucalyptus trees from seed.—E. B., Lankershim.

This was answered last week.

HOLSTEIN-FRIESIAN SALES.

The following sales of Holstein-Friesian bulls are reported in California for the week ending February 9:

Butter King, J. Rouch to Chas. D. Pierce, San Francisco.

Creamelle De Kol Keyes, E. G. Wharton to W. C. Wade, Visalia.

Sir Silver Gloss Creamelle, E. G. Wharton to C. E. Rush, Tulare.

Reports from Frazier valley near the borax mines are that many head of cattle have perished there. It appears that the cattle were far up in the mountains and were snowed in, and on account of the depth of the snow the owners could not get them out and they died for the want of food. Eight hundred head of the cattle belonged to the Snedding ranch, and they were valued at about $12,000.—Tulare Register.

A Santa Barbara Exchange says: "For preserving fruits and marketing the products a $1,000,000 corporation is to be formed here shortly, with Ellwood Cooper, State Horticultural Commissioner, at its head. Secret processes are to be used and the stock is to be placed in escrow, to prevent its being gobbled by the railroads. R. B. Canfield of this city, Charles Blagburn of Antioch and P. G. Galpin of San Francisco will be directors of the company, to be known as the American Fruit Company."

The approval and support of all friends of the Dairy Industry is urged in support of Senate Bills Nos. 66, 67 & 92, relating to appropriations for the California Polytechnic School, at San Luis Obispo: Nos. 343, 348, 349 & 455, relating to the duties of, and appropriating funds for, Inspection work of the State Dairy Bureau and defining standards of Dairy Products.

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits See O. J. Weder Co., 555-557 So. Los Angeles St., Los Angeles.

IT'S DELIGHTFUL to RIDE ON A SMOOTH COUNTRY ROAD

not only for pleasure but when you're hauling two-ton loads of baled hay. It's possible to have them when the dirt is handled right. The 20th Century Grader does it cheaply, quickly, thoroughly. No matter how clayey, muddy or rough the dirt road, it can be changed in 24 hours to a level, smooth, rutless highway. This machine is worth hundreds of dollars in the spring or fall—just the time when farmers haul their year's earnings to the market. The

20th CENTURY GRADER

is strong, rigid, durable. Puts the dirt anywhere you want it. It is easily guided and handled; light draft, two horses and one man can grade and shape a road in double-quick time. Mould-board is reversible and can be turned to either side to angle of 50 degrees. Patent shoe equalizes depth to which scraping edge cuts. Send for our new book "Delightful Roads" and see views of 20th Century Grader at work making bad roads into good ones. It also tells how to make good roads. It's free. Write us today and ask how we send a machine on approval.

RUPTURE CURED By Assisting Nature Alone

Ask Mr. Sornighausen, aged 80 years, 218 E. 30th st., Mr. John Clements, aged 82 years, Hotel Cumberland; Mr. Douglass Maylen, Hollywood; Mr. Louis Fletcher, Mgr. Hollenbeck Cafe; Mr. Joseph Welland, 332 E. First street, and a list of about five dozen more cured people, for the asking. I ask the opportunity of explaining the method. Call or write. You won't be asked to buy.

TRUSSES not alone made to fit, but to wear and hold. I make 15 KINDS, our own inventions, including several new styles, but never elastic trusses. All other mail order trusses are simply common elastic trusses.

DEFORMITIES abolutely corrected and cured with the most improved and comfortable appliances known. Our own invention. I also make elastic stockings, combination, large abdomen, supporting and reducing belts; also eight other kinds of supporting belts. Shoulder braces and Men's Suspensories, appliances and methods to cure the following ailments by home treatment. Falling womb and ovarian pains, floating kidney, navel and after-operation rupture, weak or lame back, leucorrhea (whites) or an irritated condition of the womb or vagina, constipation, itching, bleeding or protruding piles, varicose or enlarged veins, limbs, joints, sprains or dislocations, flat foot, sick headache or dizziness, especially in the aged; varicocele, hydrocele. We also carry complete maternity outfits for confinement cases and all sick room supplies and nature cure utilities for all physical weaknes. We now enjoy a large and satisfactory mail order business in all the varied lines and guarantee satisfaction to you or refund the money. Write us freely.

There is but one disease—Blood Congestion. And but one cure—Blood Circulation.

We have an institute in connection, wherein we treat all diseased conditions and force circulation by natural methods only. Consultation free. Separate rooms for ladies. 15 years' experience along this line.

CLIMATOLOGY OF INSECT PESTS.

INSECTS pests of the more malignant kind seem to be barred from the temperate regions where white men mostly live; thus the yellow fever mosquito, the stegomyia fasciata, which is the carrier of the germ of yellow fever, and the brown spotted mosquito will not live under the normal conditions of a latitude more than 48 degrees above or below the Equator.

But as an article by Mr. F. Theobold, President of the Association of Economic Biologists, points out, no one can ever tell how an insect pest will behave when placed in a new enviroment, and he shows that the spread of injurious insects by man's own vehicles of communication is a danger so real that it demands legislation to prevent the damage which may result from it.

We need only point to the ravages wrought by the cotton boll-weevil, the area infested by which has doubled in one year, to indicate the economic dangers; but there are many other insects the dominion of which is world wide, and the extension of which can usually be traced to artificial importation.

The codling moth, which has done millions of pounds worth of damage to apples threatens to spread from the United States and Canada to Australia, New Zealand, and the Cape. Its original home was in Europe. Similarly the San José scale, which attacks plums, and was originally imported into America from Japan, is now threatening Canada, Australia, and Europe.

The continents continually repay one another these bad debts. The Hessian fly, for example, a corn pest which is sometimes attributed to North America, came originally from Europe, and is known in Siberia. The insects were imported into America with straw by the hired Hessian troops of George III. The flies took up their abode in Long Island, and gradually spread over the wheat-growing acres of North America.

The stegomyia, or tiger mosquito, of which we have already spoken, is perhaps to be regarded as one of the insects which now threatens mankind. It is now to be found in every continent, and it easily breeds in the tank of ships, as it now does on Nile steamers. All the stegomyia are not, of course, infected with the yellow fever germ. If they were the threat to mankind would be great indeed.

LESSON IN INTENSIVE FARMING.

Just west of Yuma, Arizona, in the alluvial flood-plain of the Colorado, lies a little farm of 7.2 acres, which on May 1, 1905, was virgin bottomland, covered with saltweed, arrowbrush and creosote bushes. The original purpose of the tract was for planting selected varieties of date palms imported by the United States Department of Agriculture from the Old World. The Experiment Station, May 2, began preparing the ground, and on May 20 the work of levelling bordering and irrigating the tract and the planting of 152 palms, was completed.

The Plan of Work.

Recognizing, however, that a farmer with his living to make meantime, cannot afford to wait for an orchard to come into bearing, it was planned to plant crops for quick returns between the tree-rows, thus putting the work on a feasible basis from the small farmer's point of view. In order to economize ground the irrigating borders were so placed as to coincide with the rows of palms, thus utilizing space otherwise usually wasted. The tract was divided by the borders into lands, for the most part one-half an acre in size. Irrigating water from the Colorado Valley P. & I. Canal was obtained in the customary manner, and E. L. Crane, himself a Yuma Valley farmer, undertook the care of what was nicknamed our "play farm."

In size, as well as in the intensive character of the work planned, this "farm" is the opposite of the average holdings of this locality. The prevailing crops of the region are alfalfa, corn, barley, and forages in general, comparatively little attention being given to vegetables and fruits. Withal, the cost of levelling land in this region is high, rarely falling below twenty dollars an acre at current prices for labor and teams. Moreover, the cost, exclusive of maintenance, of the Government irrigating system now under construction will be about $3.50 an acre annually for ten years. To meet these and other heavy items of expenses in connection with the establishment of a farm in this region, intensive crops of a more remunerative character than those now in vogue, are essential. It was partly, therefore, as an object lesson bearing upon these financial aspects of the general situation, that this cultural work was planned.

Reclamation of the Ground.

The soil of our tract, a warm, sandy loam well adapted to gardening operations, was leveled, ditched and bordered at a contract price of $17.20 an acre, considerably less than the average for the locality, reckoning the labor of men and teams at current rates. In addition, barbed wire and posts for fencing cost $60.10; lumber for headgates cost $39.57; a drive well point and pipe, a pitcher-spout pump and a barrel, $13.45; a small lumber two-room house, including 5 1-2 days carpenter hire, $152.75; and a brush-roof shelter for horses, about $5.00. Only skilled labor employed in leveling, bordering and ditching the ground, and for part construction of the house, is included in the above estimates, as the common labor required ordinarily would be, and in this case was, furnished by the farmer himself.

To bring this ground under cultivation and make it habitable for a small farmer and his family, as stated above, therefore required cash outlay of about $400.00. In addition, in the average instance must be included a team, wagon, plow harrow, haying equipment, shovels, hoes and other small tools.

Crops and Markets.

The crops selected for the season of 1906 were Early Rose potatoes, White Bermuda onions, Rocky Ford cantaloupes, Dwarf Champion and Burpee's Quarter Century tomatoes, and alfalfa, besides a few hills of watermelons and sundry vegetables.

The produce was marketed in Yuma with the exception of tomatoes, which, for the largest part, were expressed to Tucson and Bisbee. The statement for the crops is on the basis of net cash returns to the small farmer, who with an average family of five and a team of horses is assumed to do the work required, as explained below. Items necessitating cash outlay, as seed, irrigating water, and crates

are deducted from gross returns. Water cost an average of 50 cents for irrigation per acre for the crops grown. The yields in certain instances are low, due to the unimproved condition of soil, which like desert soils in general was low in nitrogen and organic matter. Some small salty areas also affected yields locally.

From the viewpoint of the small farmer this statement shows that from less than five acres of ground its first season of cultivation, with the help of a team fed on the place, a cash capital of $127,92 and an amount of labor easily afforded by an able-bodied family of five, a net cash return of $800.17 was obtained. Taxes, repairs, and about six days work by man and team in necessary ditch cleaning, are not included in the statement but these items were about offset by a surplus of three tons of hay, and unsalable residues from the various crops grown which contributed substantially to the welfare of those living on the ground.

Meantime, the soil has been improved by cultivation, irrigation with muddy river water, and the addition of barnyard manure from alfalfa grown and fed on the place. Also, the date palms, out of the way on the borders, have made satisfactory progress.

SILK CULTURE IN CALIFORNIA.

Silk should be produced in California:

First. Because it is one of the three great textile industries of the world—and it has enriched every nation that has fostered it.

Second: Because, we as a nation, make use of nearly one-half the silk produced in the world.

Third. Because we have in superabundance all the essentials necessary to produce silk. We have vast tracts of uncultivated land. All varieties of soil and climate.

Fourth. Because the cultivation of the mulberry tree, and the production of silk from the silk worm would give renumerative and healthful employment to many thousands of men, women and children.

Fifth. Because we as a nation send out to foreign countries every year $50,000,000 to $75,000,000 for raw and reeled silk to keep our thousand silk factories supplied with material to work up.

Sixth. Because this amount of money if kept at home would broaden the fields of labor for the bread winners of our own country, and at the same time give us as a people better prestige in the world of nations.

Seventh. Because the fact of being able to produce and manufacture our own most desirable textile fabric would render us more independent in times of peace or war. We might export far more than we now import, if the Agricultural Department would take steps to develope this industry and the people would take hold of the work.

The question of cheap labor is always brought up as an objection to the silk industry being attempted in the United States. But this question is more than offset by our superior advantages.

First. We have a free, ambitious, inventive people. Our government is for the people and by the people, and every man has a right to exercise his ambition in any line of business he wants to engage in.

Second. We have a free soil and every man can be the possessor of his own acres for no greater a sum than the peasantry of Europe and the Orient pay for rent every year.

We also have more generally diffused scientific knowledge how to bring out of the soil the very best results.

Third. That same general knowledge of the best scientific methods how to treat living nature in all forms of animal life is ours much more largely than to be found in the silk-producing countries of the world.

Fourth. Our long and favorable seasons which give us more than three times the results obtainable either in the orient or the silk countries of Europe, both in foliage and the insects that feed upon it and the combined result of both.

These statements are given to the public with the hope of calling attention to the silk industry of our country. It seems to be high time that some definite action were taken in this matter. We have been too long indifferent to this great industry if the foregoing statements are correct (and I challenge anyone to disprove them.)

Thus we hold ourselves up to the ridicule of the world in failing to do what every civilized nation has been doing for centuries, namely; Giving encouragement to every branch of industry that has for its object the good of the people—the enriching of the nation.—Mrs. Carrie Williams.

DISCING ALFALA.

Prof. R. H. Forbes, of the Agricultural Experiment Station at Phoenix, has just finished interesting experiments in disc harrowing in the cultivation of alfalfa. He says, in part:

"The sharp discs, when set at the right angle, split and spread, the plants causing them to stool and send up an increased number of shoots.

"The operation should be carried on after a cutting or in winter when the alfalfa is stubble. While the discing tends to conserve the soil moisture, it also incorporates with the surface soil much fertilizing material, especially the alfalfa leaves lost in the process of haying.

"The process of discing also tends to exterminate all alfalfa pests peculiar to the location. During the process of irrigation by silt-laden water, deposits accumulate upon the surface of the field which are alike impervious to air and water. The amount of deposit is greatest at the head of a field, decreasing as it reaches the end, and experiments were made at Yuma which showed that the depreciation in the second crop was 6.3 per cent. less than the yield of alfalfa on account of the silt-blanket. At Mesa, Arizona, it was noticeable that a fourth crop irrigated by clear water was heaviest near the ditch where the silt deposit was slightest. Cultivation by means of disc and springtooth harrow is the best available means of handling the silt accumulations in the cultivation of alfalfa."

Prof. Forbes states that the average alfalfa crop in Arizona can doubtless be increased 10 per cent. by discing.

POWER OF EXAMPLE.

Knock and the world knocks with you;
Boost, and you boost alone!
When you roast good and loud,
You will find that the crowd
Has a hammer as big as your own.

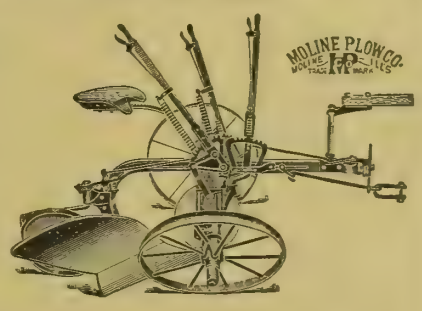
30,000 FARMERS
Bought Good Enough Sulky Plows
last season. Since its introduction the sales on this tool have increased rapidly from year to year until last season it required, in round numbers, 30,000 to supply the demand. This ought to interest a man who is going to buy a plow. It means that after due consideration 30,000 farmers agreed that the Good Enough is
"THE BEST PLOW ON EARTH FOR THE MONEY"
A MOST DESIRABLE AND ECONOMICAL FEATURE IS THE EASE WITH WHICH BOTTOMS OF DIFFERENT SIZES CAN BE FITTED TO THE SAME BEAM.



The Good Enough is extremely simple. It has the desirable features of up-to-date and high priced sulky plows without the complicated construction of the very high lift type. The land axle has a yielding spring—uneven ground does not affect depth of furrow. **Turns square corners either right or left.** The landing lever and swinging clevis permit the operator to change the land of the plow instantly without stopping the team or leaving the seat. It is furnished with pole attachment when ordered. Made right and left hand. Sizes from 10 to 18 inches. Bottoms for every condition. Will plow any soil that can be plowed with a moldboard plow.
Wheels Have Removable Hub Boxes---DUST PROOF, OIL TIGHT
The Good Enough ALFALFA BOTTOM has no equal.
ASK YOUR DEALER TO SHOW YOU THE GOOD ENOUGH.

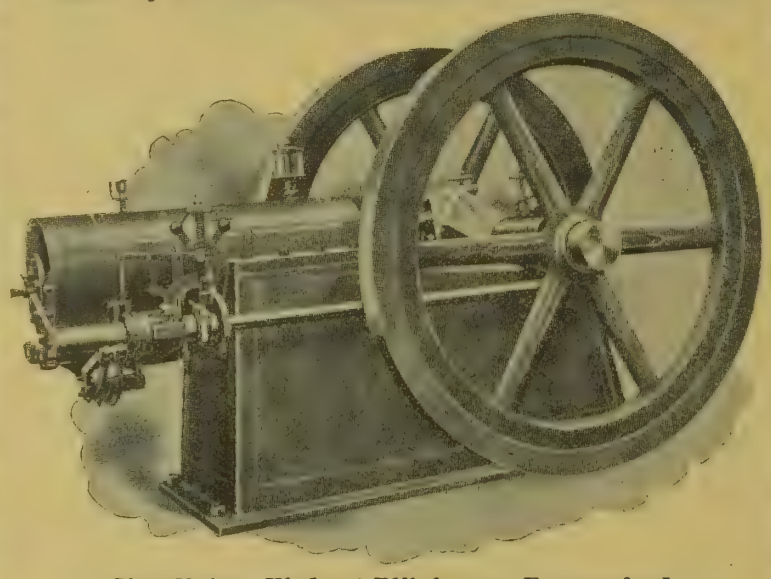
Columbus Engines

Made by the Columbus Machine Co., Columbus, Ohio



Simplicity—Highest Efficiency—Economical
Highest Grade of Material—Best of Workmanship

They have been in the field over fourteen years.

Their output is one of the largest in the United States.

What does this mean? It means that the present standard they are maintaining on Columbus Engines is the result of fourteen years labor of experienced mechanics with one of the best equipped plants in the United States behind them, to produce an engine which is simplicity in itself.

Free from all complicated and trappy devices. It don't take an expert mechanic to see the simplicity and good points on the Columbus Engine over other makes.

It don't take an experienced mechanic to operate it. We carry complete stock at all times. Come in and let us show you.

Estimates given on complete pumping plants.

Correspondence Solicited.
